	Q	R	S	T	U
	The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.			12978	12978
3401					
	Crankshaft Speed Sensors (Part Number 99180611202) are being replaced in the field for illuminating the MIL, prompting immediate customer action. The most frequently stored fault codes are: P0335 : Crankshaft Position Sensor 'A' Circuit P0336 : Crankshaft Position Sensor 'A' Circuit Range / Performance Analysis has shown that the root cause was metal particles adhering to the sensor. To combat this, the housing thickness was increased, to decrease the air gap between the sensor and the trigger wheel.			10578	146
3402					
	7 Tank Vent Purge Valves (part#s 94811002063, 94811002012, & 94811002013) are being replaced in the field for illuminating the MIL, prompting immediate customer action. 7 Desired pressure drop in the evaporative emissions system is not reached in the specified time limit when the purge valve is commanded closed setting DTC P0456. 7 Analyses revealed a damaged membrane of the purge valve due to fuel contamination. This leads to an incomplete closing of the valve. 7 An improved Tank Vent Purge Valve from a different manufacturer can be used.			774	29
3403					
3404	Due to a logistic failure the MY2018 Vehicle Emission Control Information (VECI) Label was inadvertently affixed to 81 MY2019 M4 CS models produced produced between July 1st and August 21th 2018. That means the MY2018 VECI label was affixed instead of the correct MY2019 VECI Label.	6/30/2018	2/27/2019	81	81
3405	The ECM does not set a DTC and does not illuminate the MIL as required when a malfunction causes the air-fuel ratio to differ among combustion cylinders. This can result in failure to illuminate the MIL when NOx emissions exceedances occur.			475	475
	Due to BMW internal testing (data analysis), BMW has detected an issue with component crankshaft sensor as built in different models with 3-cylinder engines B36/B38, 4-cylinder engines B46/B48 and 6-cylinder engine B58 produced between 05/16/2018 and 06/13/2018. Defect description: Software bug in the chip of the crankshaft sensor could freeze the adaptation value between the crankshaft reluctor wheel and the sensor. The signal values of the reluctor wheel would be lost, which will lead to an OBD related failure storage, reduced power and MIL illumination.	5/16/2018	6/6/2018	810	810
3406

3557	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, [permanent] DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/vehicles the locking of ECM is not active.	6/30/2017	10/30/2018	20456	20456
3558	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, [permanent] DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/vehicles the locking of ECM is not active.	6/30/2017	10/30/2018	20456	20456
3559	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, [permanent] DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/vehicles the locking of ECM is not active.	2/28/2018	7/30/2018	1098	1098
3560	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW PHEV vehicles (530e, 530e xDrive, 530e xDrive and 740e xDrive) produced between 07/01/2016 by 08/31/2018. Failure description: In case a limp home mode (full throttle operation instead of variable valve lifting/timing) is active due to a fault in the VVT (valvetronic) system, a parallel existing software failure became also active with influence on the Cold Start Emission Reduction Strategy (CSERS) and thus causing an HC emission deterioration. In more detail, during the catalytic converter warmup phase after a cold start, the warming up rate of the catalytic converter while engine warmup is reduced so that the operating temperature of the catalytic converter is reached with a delay (1-2 minutes instead of 30-40 seconds).	2/28/2017	6/29/2018	8797	8797
3561	Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: ?Coolant loss with Check-Control-Indication ?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage) ?Smell of exhaust gas ?Unusual noise from the engine compartment ?Smoke development from the engine In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017	2/28/2014	6/29/2015	1505	1505

3570	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	6/30/2015	10/30/2016	1209	1209

	Q	R	S	T	U
3590	The affected part number 13537805423 relates to the FUEL RAIL [PRESSURE ACCUMULATOR]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please note that the corresponding FIR (equivalent to FIR F-0E-3.0-11) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL [PRESSURE ACCUMULATOR] is/was working properly and has/had no malfunction.	6/30/2015	9/30/2016	1209	359
3596	The affected part number 11658600045 relates to the turbo charger. In 45% of all cases the turbo charger has to be replaced because insufficient crankcase vacuum leads to an improper oil drain which in return disables the turbo charger. In the other 55% replacement cases no MIL has been illuminated and no corresponding fault code has been stored to verify that the component has been malfunctioning.	6/30/2014	6/29/2015	20077	488
3597	The affected part number 11658600045 relates to the turbo charger. In 45% of all cases the turbo charger has to be replaced because insufficient crankcase vacuum leads to an improper oil drain which in return disables the turbo charger. In the other 55% replacement cases no MIL has been illuminated and no corresponding fault code has been stored to verify that the component has been malfunctioning.	6/30/2014	6/29/2015	20077	488
3599	Some 2017-2018MY Chrysler Pacifica ("RU") vehicles with a 3.6L Plug-in Hybrid Engine are experiencing an OBD issue where the mode \$03 power-down DTC's are clearing on power-up events when the MIL is still illuminated. This causes a situation where the storage codes and MIL are not in sync with each other.			3325	3325
3599	Complaint: MIL on without stored trouble codes. DTCs Present: No DTCs present Component: Procedure documents for flashing ECM Part Number - Production: Not Applicable Part Number - Replacement: Not Applicable Part Number - Analysis: Not Applicable Analysis: Vehicles found failing IM inspection. The affected vehicles had an incorrect procedure performed when flashing of the engine software of the engine ECU. An improper procedure may result in a system failure that does not store trouble codes after each key off cycle and consequently the warning lamps indicating system failures will cease to illuminate.			158	158
3600	Complaint: MIL on without stored trouble codes. The affected vehicles had an incorrect procedure performed when flashing of the engine software of the engine ECU. An improper procedure may result in a system failure that does not store trouble codes after each key off cycle and consequently the warning lamps indicating system failures will cease to illuminate.			280	280
3601	The affected part number 16117260648 relates to the FUEL PUMP [DELIVERY MODULE]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please note that the corresponding FIR (equivalent to FIR F-0E-3.0-11) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL PUMP [DELIVERY MODULE] is/was working properly and has/had no malfunction.	6/30/2015	9/30/2016	1209	359
3602	Some 2017, 2018MY G90 vehicles with 5.0L GDI engine may experience the intermittent faulty start under the certain RPM conditions. According to the investigation, This unusual poor start happens to vehicles when the noise signal appears during the initial ignition on/start. Hyundai will apply noise reduction logic to the Crank Shaft Position Sensor to improve this problem.			1624	5

	<p>Wrong screwing/connection of the high pressure pump (HDP) on selected model year 2018 and 2019 vehicles with 8-cylinder engines N63 produced between 10/10/2018 and 05/08/2019 (based on evaluation of the screwing curve) could lead to the following scenario: During engine operation this wrong screwing/connection of the HDP could get untightened, the HDP experiences an overload so that the adapter of the HDP could break. As a result the connected fuel line could get untightened so that fuel could leak from the fuel line. The drop down of the fuel rail pressure will be detected by OBD including fault code storage and MIL illumination. In case of further drop down a limp home mode will be activated including information for the driver.</p>	10/9/2018	6/4/2019		100

	Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.	8/17/2015	5/16/2016	27668	54
	Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.	5/18/2015	11/7/2016	79007	135
	Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.	9/23/2015	7/12/2016	17594	101
3635	On some MY2017 Nissan TITAN vehicles, customers are experiencing MIL illumination (DTC P0448) for the EVAP valve in a stuck-closed position. Nissan has investigated and found that, under certain conditions, the EPT foam seal around the fuel filler neck may not be fully secured and can potentially allow water to enter the EVAP line, filling the canister and causing the MIL illumination.			51012	27
3636	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate	11/21/2016	10/15/2017	316976	639

After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate	4/25/2017	10/3/2017	13219	8
3642	The affected part number 13537933389 relates to the INJECTOR OIL OVERFLOW RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMX703.0N57, BMW	8/31/2017	7/30/2018	3366	552
3643	DAG has identified three main root causes which may cause failure of the up-stream and down-stream NOx sensors. 1) Oscillating signal: An increased resistance in the air-reference-electrode of the sensor may lead to increased Nernst voltage which may cause the modulator to oscillate. This situation leads to a permanent deterioration of the sensor signal quality. 2) Crack due to therm			5648	66
	Cold Start Neutral, where idle speed is elevated to warm the catalytic convertor quickly, may be inhibited without triggering the Malfunction Indicator Light. Cold Start Neutral is inhibited when the data signal from the Gear Shift Module or Anti-lock Brake System are invalid. MIL illumination does not occur.			24354	42
	Cold Start Neutral, where idle speed is elevated to warm the catalytic convertor quickly, may be inhibited without triggering the Malfunction Indicator Light. Cold Start Neutral is inhibited when the data signal from the Gear Shift Module or Anti-lock Brake System are invalid. MIL illumination does not occur.			24354	42
	The affected part number 13538506547 relates to the HIGH PRESSURE PIPE (ACCUMULATOR-TO-INJECTOR). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMX703.0N57, BMW decided a warranty extension to full useful life (10 years / 120,000mi) (please see EDIR-DI-NS7-0325). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50,000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component HIGH PRESSURE PIPE (ACCUMULATOR-TO-INJECTOR) is/was working properly and has/had no malfunction.	8/31/2017	7/30/2018	3366	552
	If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaption were active at a certain level to ensure emissions are below the standards, there is a reset of these adaption which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.	2/28/2018	2/27/2019	5792	5792

	<p>Originally FCA US reported that on some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module. An extended warranty is being provided which will cover 2011-2016 MY Dodge Charger (Pursuit) vehicles equipped with sales code AHB - Police Group.</p> <p>AFCAS review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules.</p> <p>The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start.</p> <p>3674 Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.</p>			611	611

3693				72722	4259
	<p>Certain vehicles of model NCU3 could experience thermal damage of the SCR metering valve and SCR metering line. This could be due to two different root causes: 1. The defect can be the consequence of escaping hot exhaust gas is a result of loose and defective components on the exhaust system (decoupling element corroded, pipe clamp or NOx sensor loose after previous repair). As a result of the defect, no pressure can be built up in the SCR metering line. This is then detected through the diagnosis of the SCR delivery module and the MIL is activated. 2. The defect could be the consequence of a 7 misuse-scenario??, where an incorrect fueling of otto-fuel into the diesel fuel tank can lead to increased temperatures on the exhaust side and thus damage the SCR metering valve and metering line. In this case, the correct amount of AdBlue cannot be supplied to the exhaust system any more. The malfunction would be detected through the diagnosis of the SCR metering valve and the MIL would be illuminated.</p> <p>In both aforementioned cases, the SCR warning scenario is activated, which initiates the start limit with a count down of 12 max. possible vehicle starts. In both cases, performance and vehicle speed are not limited</p>

3695	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electri			51285	564
3696	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electri			18538	88
3697	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electri			25732	7
3698	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electri			8292	31
3699	In certain vehicles the evaporative emissions canister purge valve may fail due to a separation of molded rubber bumpers from the valve's internal sealing diaphragm. These loose rubber pieces, internal to the solenoid valve, can either prevent the valve from fully closing or cause noise. A manufacturing change intended to improve production yield inadvertently increased susceptibility			20396	838
	<p>Some 2018 model year Stinger vehicles equipped with 2.0 liter engines have experienced a malfunction indicator lamp (MIL) illumination with the diagnostic trouble code P053F. P053F: Fuel pressure control system (Low Fuel pressure) The main cause is lack drive current of high pressure pump in ECU.</p>				
3700	To improve this matter, Kia redesigned the ECU and has been replacing the affected ECU through a dealer service campaign action since November 2018.			7297	79
3701	2019 model year Hyundai Accent equipped with 1.6L engine have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0128. According to the investigation, the main cause is an improper data calibration for modeling temperature of the engine coolant data in ECU that has a difference of the temperature between modeling data of the engine cool			22965	71
3702	On some 2019 MY Dodge Durango and Jeep Grand Cherokee (WD/NK) vehicles with a 3.7L Hemi engine (sales code EDH) a software change error results in the inability to reset OBD Evaporative Monitor by a Mode \$04 Code Clear, module reset, or battery disconnect, once it shows "Ready" status.			14747	14747
	<p>In Voluntary Safety Recall U73, some 2017-2018 MY Chrysler Pacifica PHEV vehicles contain Powertrain Control ("PCM") software that does not remove positive torque requests from the engine controller if the CAN-C bus stops communicating while the cruise control is requesting positive torque. In the instance of a short in the vehicle causing the CAN-C bus to stop communicating while the cruise control is active and the vehicle speed is below the set speed such that the cruise control system is requesting positive torque at the exact moment of the short, it is possible for a positive torque request to be locked on the PCM which may result in either the vehicle maintaining its current speed or possibly accelerating. If the driver does not shift to neutral or apply the brakes to stop the vehicle this condition can cause a vehicle crash without warning.</p>				
3703	The vehicles noted above may also have Battery Pack Control Module ("BPCM") software that allows Permanent Fault Codes ("PFC") to clear immediately after a Mode \$04 is executed.			3324	3324
3704	Some 2017-2019 model year Niro HEV equipped with 1.6 liter engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0456, indicating a evaporative emission system very small leak detected. According to the investigation, the main cause of this failure was incorrectly functioning NVLD pressure sensor assembly due to inner part defect.			26550	45
3705	Some 2017-2019 model year Niro HEV equipped with 1.6 liter engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0456, indicating a evaporative emission system very small leak detected. According to the investigation, the main cause of this failure was incorrectly functioning NVLD pressure sensor assembly due to inner part defect.			26550	45
3706	Some 2017-2019 model year Niro HEV equipped with 1.6 liter engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0456, indicating a evaporative emission system very small leak detected. According to the investigation, the main cause of this failure was incorrectly functioning NVLD pressure sensor assembly due to inner part defect.			21891	89
3707	Some 2017-2019 model year Niro HEV equipped with 1.6 liter engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0456, indicating a evaporative emission system very small leak detected. According to the investigation, the main cause of this failure was incorrectly functioning NVLD pressure sensor assembly due to inner part defect.			27127	175
	<p>Complaint: On affected vehicles, the Mechatronic Unit service replacement was configured with a European software calibration. DTCs Present: Not applicable Component: Mechatronic Unit Part Number ? Production: OCG.325.025.B.203 with SW (5801) Part Number ? Replacement: OCG.325.025.B.203 with SW (6404 and 6304) Part Number ? Analysis: OCG.325.025.B.203 with SW (5801) Analysis: Due to a sorting issue at the transmission supplier, the mechatronic software versions were switched between Europe and USA/Canada-specific software. As a result, these affected US vehicles which received service replacement parts will not have Mode \$0A enabled.</p>				
3708				770	770
3709	Some 2015-2016 Hyundai Genesis vehicles equipped with 3.8L engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P061B and P0638. According to the investigation, the main cause is the fine jamming between the ETC (Electronic Throttle Control) valve and the housing bore; the two aluminium metals are interrupted by thermal expan			10768	19
3710	Some 2015-2016 Hyundai Genesis vehicles equipped with 3.8L engines have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P061B and P0638. 	<p>The affected part number 13537823399 relates to the INJECTOR OIL OVERFLOW RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-N57/N47-0311). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component INJECTOR OIL OVERFLOW RETURN LINE is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298
3787	<p>Front oxygen sensor, UHEGO, (linear zirconium sensor, heated air/fuel ratio sensor).</p> <p>Initial analysis indicates possible silicon contamination inside the front oxygen sensor. If this condition occurs, DTC code P017100 (MIL), long term fuel trim too lean will be set.</p>			2230	2230

3800	Front oxygen sensor, UHEGO, (linear zirconium sensor, heated air/fuel ratio sensor). Initial analysis indicates possible silicon contamination inside the front oxygen sensor. If this condition occurs, DTC code P017100 (MIL), long term fuel trim too lean will be set.			20162	20162
3801	Complaint: MIL on DTCs Present: P0456 EVAP SMALL LEAK P044EF EVAP SMALL LEAK - FRESH AIR SIDE Component: EVAP Purge Valve Part Number ? Production: 04E 133 366 CL Part Number ? Replacement: 04E 133 366 CL Part Number ? Analysis: 04E 133 366 CL Analysis: Parts received / analyzed: 13 Tested parts showed 100% no trouble found (NTF) when evaluated for vacuum, electrical resistance and functionality. Note: New vehicle Warranty claims were screened and reflected the dealer replacing the Evaporative Valve and lines due to leaks at an occurrence of 14%.			3346	26
3802	During a quality confirmation activity, which involved the inspection and potential replacement of the fuel filler pipe sub-assembly in certain vehicles after assembly and prior to dealer delivery, there is a possibility that the fuel filler pipe may not have been properly reconnected to the fuel tank. In this condition, the vehicle could not start.	10/2/2018	11/8/2018	65	65
3803	The Evaporative Emissions Leak Monitor diagnostic completion ratio can be overstated due to a miscalculation of the denominator value. The completion ratio identifies when the indicated diagnostic 'should' have completed versus when it did. The evaluation did not increment the denominator beyond a value of 1.			5624	5624
3804	The Evaporative Emissions Leak Monitor diagnostic completion ratio can be overstated due to a miscalculation of the denominator value. The completion ratio identifies when the indicated diagnostic 'should' have completed versus when it did. The evaluation did not increment the denominator beyond a value of 1.			11875	11875
3805	A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, may lead to premature component malfunction. Additionally, a deficiency in the Engine Control Module (ECM) calibration may lead to the heated sensing element experiencing thermal shock following water contact leading to sensor malfunction. Both conditions cause the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTCs), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM), also known as the Powertrain Control Module (PCM).			6084	2221
3806	A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, may lead to premature component malfunction. Additionally, a deficiency in the Engine Control Module (ECM) calibration may lead to the heated sensing element experiencing thermal shock following water contact leading to sensor malfunction. Both conditions cause the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTCs), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM), also known as the Powertrain Control Module (PCM).			2037	430
3807	A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. 3808	The affected part number 16117243975 relates to component FUEL PUMP [DELIVERY MODULE] by supplier Bosch. Analyses have shown that the impeller inside the fuel pump could block due to high dust contamination in combination with NIP (Nickel-Phosphor) abrasion and accumulation (separated NIP particles from the internal fuel pump coating). Particularly the production period 09/2013 through 03/2014 shows an increased risk of potential blocking due to a coating charge with >8% Phosphor. The NIP coating was primarily introduced to increase the durability regarding ethanol. Due to the potential blocking, the coating in the fuel pump was changed to Eloxal beginning with 04/2014 (fuel pump built in production and fuel pump used as replacement part in service). This more robust hardware (to prevent the potential blocking of the impeller) has still part number 16117243975.	8/31/2013	3/30/2014	25000	2500

	<p>The affected part number 13538506548 relates to the Fuel Injector. Analyses have shown, that depending on test group and model year in about 15% up to 52% of all cases the component fuel injector was replaced due to a valid malfunction of the component fuel injector itself. Based on poor diesel fuel quality an extended plate-out/coat inside the injector is possible. This coat results in an increased pilot injections correction. If the adaption limit monitoring/corrected energizing time exceeds a time threshold (e.g. 250 7sec), a corresponding OBD fault code (e.g. DTC P022CD for injector 1) including MIL illumination is set (injection quantity monitoring 'Zero Fuel Calibration' (ZFC)). Depending on test group and model year in about 25% up to 84% of all cases the component injector was replaced besides the malfunctioning component high pressure fuel pump (according service instruction) due to contamination of the high/low pressure system with cuttings (please see also e.g. EDIR-OF-N47/N57-0267 or EDIR-QH-N57-0324). In the other 2% up to 35% (depending on test group and model year) the component fuel injector was replaced without any valid reason (e.g. no corresponding fault code indicating a malfunctioning fuel injector).</p>	6/30/2014	6/29/2015	3701	510

	<p>Some 2016 model year Sonata PHEV(s) have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0445 (Evap. system large leak). According to the warranty parts investigation of the 18 evap. leak check modules(ELCM) in the troubled vehicles, all of the parts were operating perfectly in normal condition not only the appearance but the performance. It is Hyundai's assessment that ELCMs and fuel filler necks were replaced at the same time to fix the P0455 MIL. We found that the both parts were replaced in the same vehicles. The vehicles might have issue that the fuel filler cap was not secured to the filler neck because inner diameter of fuel filler neck was narrower than the spec. The fuel filler cap could be stuck in the filler neck before being sealed completely, and it could cause a large leak path.</p>			1032	101
3833	Strong short-distance accelerations could lead to turbocharger failures. If this driving maneuver is carried out frequently, the booster wheel of the turbocharger may become defective. Subsequently, the required boost pressure cannot be reached within the specified time. In this case, the OBD system reacts as intended, the MIL is activated and the stored fault code correctly locates the			12410	299

3801	<p>2012~2016 model year KIA Souls equipped with 1.6L engine have experienced safety issue of vehicle fire. According to the investigation, overheating of a catalyst converter which is caused by inaccurate Catalytic Overheating Protection(COP) logic could be a cause of this issue. High exhaust gas temperature could damage the catalytic converter and it can cause abnormal combustion and damage pistons and connecting rods. A failed connecting rod can pierce the engine block and cause oil leaks that can cause fires. To correct this problem, Kia will reprogram the ECU data with improved COP condition to protect the catalyst converter and replace the catalytic converter which vehicles have a malfunction indicator light (MIL) illumination with a diagnostic trouble code P0420.</p>			76899	199

3909	The Hybrid (IMA) intelligent inverter unit solder between the circuit board and electrical component may crack due to an inappropriate solder material. When the defect occurs, overheating and an open circuit may cause the MIL, IMA warning light, and battery charging warning light are illuminated by the IMA system failure (P141).	11/6/2014	6/5/2015	2634	7
3910	Daimler AG has determined that, in case a fault is detected by the monitors of the oxygen sensor heaters, specific values which can be read out by the Generic Scantool may be updated more often than specified by OBD regulations. The functionality of the monitors themselves, as well as fault freeze frame data, is not affected. In case of a detected fault, the malfunction indicator lamp will be illuminated.			6505	0
	If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine K74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.	2/28/2019	5/7/2019	1139	1139
3911					
	If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine K74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.	2/28/2019	5/7/2019	1139	1139

3931	<p>The affected part number 16117341299 relates to the Fuel Tank Supply Module. Analyses have shown, that the component fuel tank supply module in general was replaced due to a software failure in the ECU (Engine Control Unit). In more detail: The component PT-sensor (pressure/temperature sensor) located inside of the fuel tank supply module is/was monitored also during driving conditions. This could lead to the scenario, that the PT-sensor shows an implausible value (e.g. temperature drop) due to contact with fuel and the OBD diagnostic detects the PT-sensor as malfunctioning (including the corresponding fault code and MIL illumination) although the component PT-sensor is not malfunctioning. As a result the malfunctioning?? PT-sensor was replaced in services by replacing the complete fuel tank supply module.</p> <p>This means that in general the component fuel tank supply module was replaced without being malfunctioning. Beginning with July 2013, BMW has modified the ECU software so that the OBD diagnostics for component PT-sensor are only running during engine off time conditions to avoid the false failure detection and false MIL as described above.</p>	6/30/2012	6/29/2013	0	0

	<p>The affected part number 13537823399 relates to the INJECTOR OIL OVERFLOW RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03 0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-NS7/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component INJECTOR OIL OVERFLOW RETURN LINE is/was working properly and has had no malfunction.</p>	6/30/2015	10/30/2016	1209	298
3933	Some 2014~2016 model year Hyundai Elantra 2.0L, Elantra Coupe 2.0L and Kia Forte 2.0L may exhibit an issue with NMOG control that could lead to an exceeding of the emissions standards under a certain specific condition such as when the catalyst heating control is not activated. Hyundai has refined EMS data so that catalyst heating is entered to ensure the catalyst reaches the act			3545	2
	<p>The customer may experience Malfunction Indicator Light (MIL) illumination with Diagnostic Trouble Code (DTC) P2002, indicating low Diesel Particulate Filter (DPF) efficiency, stored within the Engine Control Module (ECM). Unexpected high soot loading within the DPF may lead to overheating during a regeneration event which causes the ceramic internal monolith to crack.</p> <p>Root cause has been determined to be an overly cautious coolant temperature set point of 50 degrees C before the monitoring routine to measure pressure drop across the DPF is activated.</p> <p>The Throttle Valve Actuator and Variable Swirl Valve Actuator Monitoring are monitoring continuously for a governor deviation of the throttle valve actuator or swirl valve actuator. For a limited time of ~1s the monitors could come to a false pass result, due to the signal processing within the monitor. Dependant on the customer behaviour (i.e. turning the engine of within the limited ~1s</p> <p>The Throttle Valve Actuator and Variable Swirl Valve Actuator Monitoring are monitoring continuously for a governor deviation of the throttle valve actuator or swirl valve actuator. 	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with 7 if applicable 7 Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine in all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 55d and 535d xDrive) produced between 07/01/2013 and 05/31/2017).</p>	11/30/2013	7/30/2014	4038	4038

3907	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	9612	0
3908	<p>The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956.</p> <p>Analysis have shown, that the component has been replaced in about 31% up to 42% (depending on Test Group) due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats).</p> <p>In the other 58% up to 69% (depending on Test group) of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.</p>	7/31/2015	7/30/2016	5013	401

	<p>Thermostat Inserts (part#s 9A110622602, 9A110622603) are being replaced in the field for illuminating the MIL. Fault P2181 is usually stored.</p> <p>Various root causes were found: Residual dirt in the cooling system. Spring force too low. Frictional resistance between the heating pin and sealing body.</p> <p>4053 Wax element defective.</p>			9799	36
	<p>Component: Fuel low pressure sensor (LPS). The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail.</p> <p>The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load.</p> <p>The concerned sensor went of production 2016 week 16.</p> <p>4054</p>			15300	15300

	Q	R	S	T	U
	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>				
4006		2/28/2013	4/29/2014	15633	1200
	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>

4116		8TYXV03.5BBB	2008	Fuel Delivery System (Fuel Tank, Pumps, Roll-over Valves, etc.)

	Q	R	S	T	U
4100	<p>The affected part number 16117243972 relates to the FUEL PUMP [DELIVERY MODULE]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMV02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mls) (please note that the corresponding FR (equivalent to FR F-06-2.0-9) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mls). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL PUMP [DELIVERY MODULE] is/was working properly and has/had no malfunction.</p>	6/30/2014	5/31/2015	3695	377
4110	<p>The affected part number 11787614322 relates to the Heated Rear Oxygen Sensor. Analyses have shown, that the component rear oxygen sensor was replaced in 100% of all cases due to different valid malfunctions:</p> <p>a) Contamination of the oxygen sensor (boron is dispensed from the boron nitride disk)</p> <p>b) Break of the ceramic caused by vibrations due to material degradation in the heater element causes by phase shifting from tetragonal to a monocline phase in the area of the through-connection holes of the ceramics</p> <p>c) Signal adulteration caused by humidity entrance via plug of the oxygen sensor</p> <p>All of this malfunctions lead to an OBD fault code storage (e.g. P0141 and P0161) including MIL illumination.</p>	2/28/2013	5/31/2014	15275	1833
4111	<p>The affected part number 11787614322 relates to the Heated Rear Oxygen Sensor. 4112	<p>DAG has determined that the diesel particulate filter may crack due to an insufficiently robust welded connection. Specific environmental influences in the form of corrosion could also have a negative effect on the long term durability of the diesel particulate filter. This can lead to tensions within the exhaust system and thus also may cause the diesel particulate filter to crack.</p> <p>In addition, in individual cases, it may be that during repairs to the exhaust system that are unrelated to a defect of the diesel particulate filter, the exhaust system was not replaced in accordance with the DAG specifications. Specifically, the issue might arise where it is necessary for the workshop to replace the exhaust system (including the diesel particulate filter) and the replacement system is not fitted according to DAG specifications. This can lead to tensions within the exhaust system and thus may also cause the diesel particulate filter to crack.</p> <p>In both cases, a fault is stored in the engine control unit software and the engine diagnostics warning lamp (MIL) is activated.</p>			13424	1573
4113	Customer vehicle may exhibit decreased front windshield defroster performance at extremely low ambient temperatures. This condition may be the result of the fresh/recirculation servo actuator separating from the servo, causing the HVAC system to become stuck in recirculation.				7482
4114	Customer vehicle may exhibit decreased front windshield defroster performance at extremely low ambient temperatures. This condition may be the result of the fresh/recirculation servo actuator separating from the servo, causing the HVAC system to become stuck in recirculation.				11213
4115	<p>The subject vehicles are equipped with a 3.5L V6 2GR-FSE gasoline engine with an intake port injection system containing two fuel pulsation dampers. The diaphragm material in the fuel pulsation dampers may harden over time due to a chemical process involving amine in the fuel, higher ethanol content in fuels used in countries such as the U.S., Canada, and China, and high temperatures. If this were to occur, cracks could develop on the diaphragm, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.</p>			6829	6829

4144	Some 2017 thru 2019 model year Ram 1500 (7D5??), Jeep Wrangler (7JK/JL??), Jeep Cherokee (PKL??), Jeep Compass (7MP??), Jeep Grand Cherokee (7WK??), Jeep Renegade (7BU??), Fiat 500X (7FB??), Dodge Journey (7JC??), Dodge Durango (7WD??), Dodge Challenger (7LA??), Dodge Charger (7LD??), Chrysler 300 (7LX??), Chrysler Town and Country/Dodge Grand Caravan (7RT??) and Chrysler P				3838
4145	Some 2018-2019 MY 2.0L and 3.6L Jeep Wrangler 850 and some 2019 MY 3.6L and 5.7L Ram 1500 Pick Up 850 vehicles may experience a software implementation issue that does not allow the OBD Evaporative Small Leak Detection to be enabled unless the engine runs for 5 minutes continuously without an auto stop before the key is turned off.				289289
4146	On some 2016 Infiniti Q50 vehicles (3.0L V6), customers are experiencing an engine misfire or rough running condition with associated MIL illumination (DTC P0301-P0306). Infiniti has investigated and found that the fuel injector may possibly become stuck open due to the potential presence of burrs left behind in the fuel supply	10/20/2015	7/25/2016		1581969
4147	In certain vehicles a performance fault may occur in the fuel injector control circuits internal to the Engine Control Module (ECM). This is typically caused by an ECM component failure. These faults cause the MIL to illuminate and typically limit fuel injector function.				5217237
	ome 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selection of the printing plate.				65928234
4148	Hyundai will replace the misprinted filler caps with the right ones.				
	ome 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selection of the printing plate.				65928234
4149	Hyundai will replace the misprinted filler caps with the right ones.				
4150	Due to inappropriate calibration of the PCV and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	7/28/2016	10/3/2017		4209727
4151	When operating under certain conditions involving high altitude and temperature, the vehicle may experience DTW P3190 (Poor Engine Power) and reduced internal combustion engine power. In this condition, the vehicle will illuminate the check engine light and may enter an EV fail-safe mode if the internal combustion engine shuts down.				1470414704
4152	Some 2017 MY Alfa Romeo Giulia (7GA??) and 2018 MY Alfa Romeo Giulia and Stelvio (7GU??) vehicles equipped with a 2.0L engine (sales code EC2) may have engine control software with inadequate catalyst protection. Engine misfire conditions can lead to elevated catalytic converter temperatures. This may result in localized damage to wiring and components in the engine compartment.				2460824608
	Customer Complaint: MIL on; Component: ECM Software; Production Part Number: 8T2 907 560 F V0003; Warranty Replacement Part Number / Version: 8T2 907 560 F V0005; The following DTC was observed: P130B (Low Fuel Pressure regulation, Fuel pressure outside specification); Analysis: Fuel pressure is out of tolerance due to the minimum threshold for the pulse-width signal from the Engine Control Module to the Fuel Transfer Pump was set too high.				154594
4153	duplicate				697803
	After the 7sport response?? drive program is terminated, the exhaust flaps stay open for the whole driving cycle and the Cylinder Deactivation function is Disabled. The exhaust flaps stay opened and the cylinder deactivation is also disabled in the next driving cycle If the driver changes the drive program or selects the Sport Exhaust: the position of the exhaust flaps close and cylinder deactivation is enabled again. The topic is relevant for the Panamera, Panamera S and Panamera Turbo. There is only an influence of the fuel consumption at the Panamera Turbo.	9/24/2016	6/13/2017		34380
4155					
	Some 2018 model year Kia Stinger, Cadenza, 2019 model year Sedona, Optima, Sorento vehicles have the misprinted on the engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selection of the printing plate.				1818
4156	Kia will replace the misprinted filler caps with the right ones.				
	The affected part number 13518604232 relates to the component HIGH PRESSURE FUEL PUMP. Analysis has shown that in about 81% of all cases the high pressure pump has been replaced due to a correct fault code entry and MIL illumination, identifying the malfunction of that specific component. Deterioration of gasoline filter materials emitting small filter particles, lead to a blockade of the high pressure valve. The deterioration of the gasoline filter could be traced back to high temperature conditions and low gasoline quality respectively inadequate gasoline additives. Beginning with 12/2015 a new filter material (7PEEK?? instead of PA) for the filter was introduced in production and services.	2/28/2014	5/31/2015		114451259

4167	<p>The affected part number 13538594893 relates to the Fuel Line to High Pressure Pump. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMXV02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please note that the corresponding RIR (equivalent to FIR F-06.2.0-9) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW's services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component Fuel Line to High Pressure Pump is/was working properly and has/had no malfunction.</p>	6/30/2014 8/29/2017	5/31/2015 4/23/2018	3701 1645	282 0
4169	<p>2019 model year KIA Niro/Optima hybrid and plug-in hybrid have an issue that is inappropriate display of the freeze frame data to a general scan tool. According to the investigation, when multiple DTCs are set including misfire or fuel system DTC, the ECU cannot display correctly the misfire or the fuel system freeze frame information after ignition off and on. The main cause is that ECU has been calibrated improperly when it comes to display freeze frame data if it occurs multiple DTCs.</p>			95	95
4170	<p>2019 model year KIA Niro/Optima hybrid and plug-in hybrid have an issue that is inappropriate display of the freeze frame data to a general scan tool. 4173	<p>The affected part numbers 51137497285, 51747497279, 51748091762 and 51138091760 relate to the Lower and Upper Air Flaps (Active Grill Shutters). Analyses have shown that these components were replaced in about 95% of all cases due to a malfunction detected by the OBD system including fault code storage and MIL illumination (e.g. electrical failure of actuator, stuck shutter, shutter performance). There are two different failures which could cause these valid malfunctions:</p> <p>Failure#1 (about 85% of all valid failures): Contamination (mix of transmission oil, brush dust and copper abrasion) of the commutator (daubed commutator slit) leads to an increased current of the actuator so that this component fails. Failure#2 (about 15% of all valid failures): The kinematics /component ?space?? (connecting element of the coupling bar between actuator and the shutters) could be unhinged or lost, so that the shutters could not be controlled/moved any more.</p>	10/31/2016	5/31/2017	10282	4833
4174	<p>The affected part number 13538594893 relates to the Fuel Line to High Pressure Pump. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMXV02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mls). Please see corresponding EDIR-OF-N57/N47-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mls). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component Fuel Line to High Pressure Pump is/was working properly and has/had no malfunction.</p>	6/30/2014	5/31/2015	3701	282

4200	Daimler AG has determined that on certain S-Class (platforms 217 and 222) vehicles in one special use case the software might detect a misfire even when no misfire occurred. The issue only occurs when driving down a hill while catalyst heating may be necessary (about max. 60 seconds after cold start of the engine). In this case, the Malfunction Indicator Lamp (MIL) would erroneously illuminate.			11869	24
4201	Daimler AG has determined that on certain S-Class (platforms 217 and 222) and E-Class (platform 213) vehicles the software might detect a misfire even when no misfire occurred. In this case the Malfunction Indicator Lamp (MIL) would erroneously illuminate, and report a misfire even though no misfire had occurred.	10/31/2016	6/29/2018	1887	510
4202	Daimler AG has determined that certain C-Class vehicles (205 platform) experience a software error. Due to moisture in the pump module, the electric signals that control the pump of the tank leak diagnosis might be misinterpreted by the system. In this case a fault would be detected erroneously and the MIL would be activated falsely although the system works properly. Subsequently			3024	0
4203	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.			99342	4
4204	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.			26419	0
4205	Daimler AG has determined that certain M-Class (platform 167), C-Class (platform 205), CLS-Class (platform 257), E-Class (platform 213 and 238) and S-Class (platform 217 and 222) experience a software error. In case of the described defect, stored faults could be deleted prior to completion of a full driving cycle. As a result the MIL might not be activated.			221	0
4206	<p>Daimler AG has determined that on certain GLE-Class (platform 166), SL-Class (platform 172), C-Class (platform 204), E-Class (platforms 207, 212), S-Class (platforms 216, 217, 221, 222), CLS-Class (platform 218), SL-Class (platform 231), R-Class (platform 251), GLC-Class (platform 253), G-Class (platform 463) vehicles with 4-, 6- and 8-cylinder gasoline engines catalyst heating might not be active in one special use case. The issue only occurs when the following unusual circumstances occur in combination:</p> <p>The engine is turned off after a driving cycle where it was fully warmed up. At the next engine start / driving cycle the engine is started and turned off after no more than 2 seconds of operation. At the subsequent engine start / driving cycle catalyst-heating is not activated.</p> <p>In this case, due to a delayed heating up of the catalyst, an impact on emissions cannot be ruled out.</p>			10322	0

4210	<p>The affected part number 13538616079 relates to component injection valve (fuel injector) by supplier Continental, which is only used for model X6 xDrive50i (for model X5 xDrive50i an injector by supplier Bosch is built; please see also EDIR-06-N63TUE-0251). This part number 13538616079 is used in production beginning with 02/2013. Analyses have shown, that in about 50% of all cases the component injection valve was replaced due to misfire events including fault code storage and MIL illumination. In general these misfire events were be caused by an electrical malfunction (faulty operation of the injector) due to contamination (welding bead) at the contact/connection caused by the supplier during the production process. In addition leakages due to gelation of the compensator (in general after a dead time of 2 up to 3 years due to oxygen entered in the compensator oil of the fuel injector) or a defective filter material (filter material shows breaks pollutant particles leading to temporary or steady leakages of the injection valve) could also lead to the misfire events. In the other 50% of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. In these cases other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for the fault code storage (e.g. for misfire) and MIL illumination.</p>	3/31/2013	12/30/2014	4615	2215
4211	<p>Daimler AG has determined that certain MY12-18 vehicles of diverse platforms could experience a software error. If a shortcut occurred within the injector while the engine was switched off, the failure code for this short cut would not be stored and the MIL would not be activated. However, in case of a confirmed shortcut, the MIL would be activated by a subsequent failure mechanism (misfire detection) and the workshop would replace the correct part. Based on a field claim analysis of potentially affected vehicles worldwide, the probability of occurrence of the described failure is lower than 0.00018 %.</p>			2313	0

4222	<p>Avapor lock condition in the fuel delivery system can occur after extended periods of engine idle when the ambient temperature is greater than 100 degF. Under these conditions the fuel flow rate from the in-tank mounted fuel pump may be sufficiently low that the liquid fuel can vaporize in the fuel delivery system and fuel pump resulting in pump cavitation or stalling.</p>			7303	23
4223	<p>The affected part number 16127224638 relates to the MIDDLE FUEL RETURN LINE (RETURN PIPE). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMT03.0N57, a final decision based on the final analysis results is expected in 01/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mls; equivalent to EDR-0E-N57-0177) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). In case the high pressure fuel pump is pre-damaged or already malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mls). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component MIDDLE FUEL RETURN LINE (RETURN PIPE) is/was working properly and has/had no malfunction.</p>	7/31/2016	7/31/2017	2614	544
4224	<p>The affected part numbers 13538596875 and 13538596876 relate to the FRONT and REAR HP PUMP-TO RAIL FUEL LINE (PRESSURE HOSE ASSY). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMT03.0N57, a final decision based on the final analysis results is expected in 01/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mls; equivalent to EDR-0E-N57-0177) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). In case the high pressure fuel pump is pre-damaged or already malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mls). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FRONT and REAR HP PUMP-TO RAIL FUEL LINE (PRESSURE HOSE ASSY) is/was working properly and has/had no malfunction.</p>	7/31/2016	7/31/2017	2614	544
4225	<p>The affected part number 17117537292 relates to the RADIATOR W/DORS. Analyses have shown that in about 80% of all cases this component was replaced in service due to leakages. In the other about 20% of all cases a malfunctioning DORS sensor (e.g. electrical failure including fault code storage and MIL illumination) was the reason to replace the complete DORS system including also the DORS radiator although the coated DORS radiator itself was not defective and met still the functional requirements (convert ozone in oxygen).</p>	8/31/2009	1/31/2010	19097	1184

	<p>Complaint: MIL on without stored trouble codes. DTCs Present: No DTCs present Component: Procedure documents for flashing ECM Part Number - Production: Not Applicable Part Number - Replacement: Not Applicable Part Number - Analysis: Not Applicable Analysis: Vehicles found failing IM inspection. The affected vehicles had an incorrect procedure performed when flashing of the engine software of the engine ECU. An improper procedure may result in a system failure that does not store trouble codes after each key off cycle and consequently the warning lamps indicating system failures will cease to illuminate.</p>			280	280
4235	Some 2018 model year 3.0L F-150 Diesel vehicles were built with a bypass valve flap within the EGR module that may become detached when screws back out. This can result in loss of EGR cooling and control.			10544	2
	<p>Some 2017, 2018MY G90 vehicles with 5.0L GDI engine may experience the intermittent faulty start under the certain RPM conditions. According to the investigation, This unusual poor start happens to vehicles when the noise signal appears during the initial ignition on/start. Hyundai will apply noise reduction logic to the Crank Shaft Position Sensor to improve this problem.</p>			1772	4
4236				22975	1107
4237	Daimler AG has determined that certain GLE-Class vehicles (166 platform) with 8-cylinder gasoline engine (M278) might experience a software error. For a plausible test result of the monitor of the downstream oxygen sensor, the monitor is intended to be aborted as soon as driving conditions (load) are no longer constant. However, the exit conditions of the monitor on these vehicles may

4242	The evaporative canister filter may become blocked by the combination of accumulated dirt and snow if driven in an extremely dirty environment. The MIL may illuminate for P2422 "Evaporative Emission (EVAP) System Vent Shut Valve Close Malfunction".	6/20/2016	12/4/2017	152785	20
4243	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	6/20/2016	12/4/2017	129467	58
4244	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	9/23/2015	7/12/2016	17594	73
	<p>The affected part number 11538674895 relates to the Thermostat (including a map controlled heating element). This component has been used beginning with 07/2016 in production. It also has been used in service since 07/2016 as replacement part, whenever a component with part number 11537647751 used in production by 06/2016 was malfunctioning. Analysis have shown, that in about 100 percent of all cases for model year 2016 models listed above, the originally built thermostat (11537647751) was replaced due to a disconnected pin of the heating element caused by corrosion due to moisture ingress in the thermostat housing. The corrosion leads to an increased power resistance of the connecting (pin), which is detected by the OBD system including fault code storage and MIL illumination. After this thermostat malfunction is detected (confirmed), the thermostat is still mechanical controlled (wax elements melts due to rising engine cooling water temperature and not map controlled by the heating element anymore) as a conventional thermostat. The succeeding built in thermostat (11538674895) didn't show significant numbers of malfunctions as pre described and so could be handled as a robust hardware. The Weibull and valid failure values reported in this document for test group (BMKV01_6N18 and part number 11538674895 relates therefore to the built thermostat with part number 11537647751. Component with part number 11538674895 is a robust hardware and itself has/had no malfunction, but was/is working properly.</p>	6/30/2015	10/30/2016	13901	4782
4245	In certain vehicles a refrigerant leak may occur at the receiver/hydrator plug on the air conditioning system condenser. The suspected cause is a variation in thermal expansion properties between the plug and the condenser combined with a degradation of the sealing o-ring at low ambient temperatures.			53498	90

4256	<p>DAG has determined that the depressed valve system (exhaust) could cause increased lateral forces in the valve guide, which increase wear in the guide and can lead to wear of the seat ring. In this case, the tightness of the combustion chamber (valve to seat ring) could be impaired. In case of an untight combustion chamber, misfires could occur leading to a deactivation of the respective</p>					
4257	<p>Wrong screwing/connection of the high pressure pump (HDP) on selected model year 2018 and 2019 vehicles with 8-cylinder engines N63 produced between 10/10/2018 and 05/08/2019 (based on evaluation of the screwing curve) could lead to the following scenario: During engine operation this wrong screwing/connection of the HDP could get untightened, the HDP experiences an overload so that the adapter of the HDP could break. As a result the connected fuel line could get untightened so that fuel could leak from the fuel line. The drop down of the fuel rail pressure will be detected by OBD including fault code storage and MIL illumination. In case of further drop down a limp home mode will be activated including information for the driver.</p>	10/9/2018	6/4/2019		100	100

	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	6/30/2017	6/29/2018	1110	1110

	<p>Some 2018 model year Hyundai IONIQ Hybrid 1.6L vehicles have experienced malfunction indicator light (MIL) illumination accompanied by diagnostic trouble code P0455. According to the warranty parts investigation, a salt crystal that was located inside of poppet seal of NVLD was observed. Hyundai found out the salt crystal made poppet valve of NVLD stuck and did not detect very small leak in evaporative system. It is assumed that the salt crystal has been originated from the contents of sea breeze and fog coming from the California coast area.</p> <p>4290 To improve this matter, Hyundai will develop a countermeasure part and publish a Technical Service Bulletin to provide repair information to Hyundai dealers and will replace the affected NVLDs and filters by service action.</p>			144883	162
	<p>Some 2014-2019MY Ram 1500 ("DS") Trucks equipped with a 5.7L engine may experience exhaust manifold fastener failures due to metallurgical fatigue. This situation has the potential to cause both an unusual noise (ticking) from the engine compartment, as well as a localized gasket leak located at the exhaust manifold-cylinder head interface.</p> <p>4300</p>			147677	7
	<p>Originally FCA US reported that on some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module. An extended warranty is being provided which will cover 2011-2016 MY Dodge Charger (Pursuit) vehicles equipped with sales code AHB - Police Group.</p> <p>AFCA US review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules.</p> <p>The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start.</p> <p>4301 Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.</p>			1645	1645

	Q	R	S	T	U
	<p>Originally FCA US reported that on some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module. An extended warranty is being provided which will cover 2011-2016 MY Dodge Charger (Pursuit) vehicles equipped with sales code AHB - Police Group.</p> <p>AFCA US review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules.</p> <p>The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start.</p> <p>4306 Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.</p>			8811	8811
	<p>Hyundai Motors America, Inc. is conducting an important Product Improvement Campaign to update software on 2011~2018 MY Sonata, 2013~2018 MY Santa Fe Sport, 2014~2015 MY and 2018 MY Tucson vehicles equipped with 2.0L and 2.4L GDI engines to protect the engine from connecting rod bearing damage..</p> <p>The update will only involve the addition of newly developed computer software for the Engine Control Unit (ECU).</p> <p>Hyundai recently developed a Knock Sensor Detection System (KSDS) that detects vibrations indicating the onset of connecting rod bearing wear in the engine.</p> <p>4307 The KSDS is designed to alert a vehicle driver at an early stage of bearing wear before the occurrence of engine damage including engine failure.</p>			87651	0

In the presence of an ignition source, leaking fuel may result in a fire.</p>			10381	10381
4316	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2018	4/30/2019	203	0
4317	<p>Analyses have shown, that in about 43% of all cases the component fuel injector was replaced due to a valid malfunction of the component fuel injector itself. Based on poor diesel fuel quality an extended plate-out/coat inside the injector is possible. This coat results in an increased pilot injections correction. If the adaption limit monitoring/corrected energizing time exceeds a time threshold (e.g. 250 Tsec), a corresponding OBD fault code (e.g. DTC P0220 for injector 1) including MIL illumination is set (injection quantity monitoring ?Zero Fuel Calibration [ZFC]). In about 50% of all cases the component injector was replaced besides the malfunctioning component high pressure fuel pump (according service instruction) due to contamination of the high/low pressure system with cuttings (please see also e.g. IDIR-0F-M47/N57-0267 or EDIR-OH-N57-0324). In the other about 7% the component fuel injector was replaced without any valid reason (e.g. no corresponding fault code indicating a malfunctioning fuel injector).</p>	6/30/2016	6/29/2017	1502	269
4318	<p>On certain six-cylinder diesel E350 BlueTec vehicles, the intake port shutoff actuator motor could have failed due to electrical short circuit faults. These are caused by oil contamination coming from a leaky clean air line connector to the turbo charger, positioned directly above the actuator motor.</p> <p>In the clean air line, blow-by-gas is mixed with clean air. Usually blow-by-gas contains traces of oil due to crank case ventilation. In case of a leakage at the clean air line connector, oil could weep after engine stand still. As long the engine is running, there is underpressure in the clean air line, so it is ensured blow-by-gas can't get out at the connector.</p> <p>The oil contamination could crawl inside the actuator housing and could lead to electrical short circuit faults. These short circuit faults would lead to a failing of the actuator motor and an illumination of the Malfunction Indicator Lamp (MIL).</p> <p>The root cause of the leakage is incorrect reinstallation of the clean air line in some workshops. The incorrect reinstallation is a deviation from our work instruction.</p> <p>There is no known fault caused by the actuator motor itself.</p>			4998	178

These short circuit faults would lead to a failing of the actuator motor and an illumination of the Malfunction Indicator Lamp (MIL).</p> <p>The root cause of the leakage is incorrect reinstallation of the clean air line in some workshops. The incorrect reinstallation is a deviation from our work instruction.</p> <p>There is no known fault caused by the actuator motor itself.</p>			1267	32
4319	<p>Following NOx sensor components have been introduced into production and as spare parts in service during the specific time periods:</p> <p>10/13 - 07/16: NOx sensor (downstream) with part number 13628576469 (models 328d and X5 xDrive35d), NOx sensor (downstream) with part number 13628576470 (model X3 xDrive28d), NOx sensor (downstream) with part number 13628576471 (models 535d and 740Ld xDrive) NOx sensor (upstream) with part number 13628576471 (models 535d, 740Ld xDrive, 328d, X5 xDrive35d and X3 xDrive28d)</p> <p>07/16 - now: NOx sensor (upstream) with part number 13628589846 (models 535d, 740Ld xDrive, 328d, X5 xDrive35d and X3 xDrive28d) NOx sensor (downstream) with part number 13628589845 (model X3 xDrive28d) NOx sensor (downstream) with part number 13628589844 (models 328d and X5 xDrive35d) NOx sensor (downstream) with part number 13628589846 (models 535d and 740Ld xDrive)</p> <p>Components with part numbers 13628589844, 13628589845, 13628589846 are improved / more robust NOx sensors, which have been used as spare part in service since 07/2016, whenever NOx sensors with above listed part numbers used before 07/16 were malfunctioning. Analysis have shown that component NOx sensor (up- and downstream) with above listed part numbers used before 07/16 have been replaced due to a Magnesium intoxication (major root cause of all malfunctions) as well as due to other permanent or temporarily errors as electrical malfunctions (short to ground or open circuit), all with a corresponding OBD fault code storage and MIL illumination.</p>				
4320	<p>Since 07/16 the component NOx sensor up- and downstream with part numbers 13628589844, 13628589845, 13628589846 have been used in production and as spare parts in service. Those components have/had no malfunctions and are/were working properly.</p>	6/30/2015	6/29/2016	1579	513

4322	Certain vehicles may have a condition which affects the electrical connections to the vehicle's accelerator pedal position sensors. Electrical connection to these sensors may be lost at times, intermittently. This is caused by dimensional variation in the pedal sensor housing that can allow the sensor's electrical terminal buck to move relative to the sensor's circuit board.			165032	6679
4323	Certain vehicles may have a condition which affects the electrical connections to the vehicle's accelerator pedal position sensors. Electrical connection to these sensors may be lost at times, intermittently. This is caused by dimensional variation in the pedal sensor housing that can allow the sensor's electrical terminal buck to move relative to the sensor's circuit board.			22208	175
4324	Some 2016-2017 Jeep Compass/Patriot (MC) vehicles with a 2.4L engine (ED3) and automatic transmission (D44) may have a Transmission Range Sensor (TRS) that will set a MIL and DTC Codes P0705 (TRSA Circuit (PRNDL Input)) and/or P0706 (TRSP Performance), due to a terminal flatness issue on the sensor.			53513	340
4325	An incorrect specification front exhaust tube (with catalytic converter included) may have been installed on a limited number of 2019 Nissan Altima vehicles. This error is due to the part pick area operator sending non-US parts to the assembly line to support a trial build.	10/25/2018	10/25/2018	48	6
4326	<p>Cold Start Neutral, where idle speed is elevated to warm the catalytic converter quickly, may be inhibited without triggering the Malfunction Indicator Light. Cold Start Neutral is inhibited when the data signal from the Gear Shift Module or Anti-lock Brake System are invalid.</p> <p>MIL illumination does not occur.</p> <p>Revision: Further investigation has confirmed that in all known operating instances the Powertrain Control Module detects the fault and does successfully trigger MIL illumination. Further investigation has established that there is no defect present as was originally described below.</p>			0	0
4327	<p>Certain vehicles of model NCV3 could experience thermal damage of the SCR metering valve and SCR metering line. This could be due to two different root causes:</p> <p>1. The defect can be the consequence of escaping hot exhaust gas is a result of loose and defective components on the exhaust system (decoupling element corroded, pipe clamp or NOx sensor loose after previous repair). As a result of the defect, no pressure can be built up in the SCR metering line. This is then detected through the diagnosis of the SCR delivery module and the MIL is activated.</p> <p>2. The defect could be the consequence of a 7misuse-scenario??, where an incorrect fueling of otto-fuel into the diesel fuel tank can lead to increased temperatures on the exhaust side and thus damage the SCR metering valve and metering line. In this case, the correct amount of AdBlue cannot be supplied to the exhaust system any more. The malfunction would be detected through the diagnosis of the SCR metering valve and the MIL would be illuminated.</p> <p>In both aforementioned cases, the SCR warning scenario is activated, which initiates the start limit with a count down of 12 max. possible vehicle starts. In both cases, performance and vehicle speed are not limited</p>			6577	340
4328	On certain six-cylinder plug-in hybrid vehicles (S550 Hybrid, S550 e and GLE550 e 4MATIC) the temperature sensor in the electric machine may send implausible values due to temporary short circuit at the contact. In case of the described defect, the Check Engine Light (MIL) would be illuminated, prompting the driver to visit a servicing dealer, and the maximum power of the hybrid system would be limited.			156	1
4329	In certain vehicles and under certain conditions, the engine's fuel injectors may deliver an improper amount of fuel. The typical identified fuel injector failures are due to wear on the armature caused by a combination of a vibration in the armature and the propensity of the armature to spin on the pintle perch.			72479	1150
4330	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			284104	693
4331	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			5448	12
4332	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			371890	1003
4333	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			25986	25
4334	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			259344	610
4335	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			107963	78
4336	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			26024	8
4337	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electrical circuit malfunction).			367617	1071
4338	<p>-Complaint: No known customer complaint -Component: EGR Cooler and Valve Assembly -Possible DTCs Present: No DTCs present -Due to a parts catalog error, an incorrect EGR Cooler and Valve Assembly may have been installed on some vehicles during a past service repair visit. Audi will inspect, and if needed replace the component as a proactive measure to ensure continued emissions compliance.</p> <p>-Incorrect Part Number: EGR Cooler (059 131 515 F) -Correct Part Number: EGR Cooler (059 131 515 FP)</p>			36	36
4339	In some cases, over time, fretting dust can get into the supercharger bearing and stick in the bearing grease, contaminating the grease and acting as an abrasive agent to the rollers in the bearing. The contaminated grease then may fail to adequately lubricate the bearing. With inadequate lubrication, the bearing may begin to squeal. If left unaddressed, the bearing may overheat and seize.			2116	248

	Q	R	S	T	U
	<p>In Voluntary Safety Recall U73, some 2017-2018 MY Chrysler Pacifica PHEV vehicles contain Powertrain Control ("PCM") Software that does not remove positive torque requests from the engine controller if the CAN-C bus stops communicating while the cruise control is requesting positive torque. In the instance of a short in the vehicle causing the CAN-C bus to stop communicating while the cruise control is active and the vehicle speed is below the set speed such that the cruise control system is requesting positive torque at the exact moment of the short, it is possible for a positive torque request to be locked on the PCM which may result in either the vehicle maintaining its current speed or possibly accelerating. If the driver does not shift to neutral or apply the brakes to stop the vehicle this condition can cause a vehicle crash without warning.</p> <p>4352 The vehicles noted above may also have Battery Pack Control Module ("BPCM") software that allows Permanent Fault Codes ("PFC") to clear immediately after a Mode S04 is executed.</p> <p>4353 Some 2019 MY Dodge Challenger (7LA??) and Charger (7LD??) and Chrysler 300 (7LX??) vehicles may have been built with an instrument cluster that has an inadvertently disabled watchdog, which may allow a lockup condition to occur. Lockups have been confirmed to happen during sleep, wake, and ignition cycles, but the potential exists during any event that would have caused a reset.</p> <p>4359 Some 2019 MY Dodge Challenger (7LA??) and Charger (7LD??) and Chrysler 300 (7LX??) vehicles may have been built with an instrument cluster that has an inadvertently disabled watchdog, which may allow a lockup condition to occur. Lockups have been confirmed to happen during sleep, wake, and ignition cycles, but the potential exists during any event that would have caused a reset.</p>				1146311463
	<p>Some 2015 model year Rio/Soul vehicles equipped with 1.6 liter engines have experienced a malfunction indicator lamp (MIL) illumination with the diagnostic trouble code P0420, indicating a catalyst system. According to the investigation, overheating of a catalyst converter which is caused by inaccurate Catalytic Overheating Protection (COP) logic could be a cause of this issue.</p> <p>4360 To improve this matter, Kia has been reprogramming the ECU data with improved COP condition to protect and replace the catalyst converter on vehicles with malfunctioning indicator light (MIL) illumination (diagnostic trouble code P0420) through a dealer service campaign since April 2019.</p> <p>4361 On some 2017-2018 Nissan Pathfinder and Infiniti QX60 vehicles, customers are experiencing MIL illumination related to low fuel system pressure (P0087), when a problem does not exist. Nissan has investigated and found that, under certain conditions (fuel level below 1/2 tank), the low fuel system pressure is detected because the low fuel level was not properly stored as part of the mo</p>				83698479
	<p>Excessive wear on internal component of the Intake Variable Camshaft Timing Solenoid may lead to premature failure of the solenoid.</p> <p>As component wears correct operation of the solenoid may be affected leading to Malfunction Indicator Light (MIL) illumination.</p> <p>Where wear is sufficient to prevent correct operation, MIL illumination will occur.</p> <p>4362 Excessive wear has been attributed to internal component material selection of bronze graphite.</p>				24412373
	<p>Complaint: Delayed shift and noise coming from transmission. 4418	Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter: 1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning. 2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.			12412	260
4419	Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter: 1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning. 2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.			7336	327
4420	Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter: 1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning. 2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.			9441	108
4421	The affected part number 13538506547 relates to the HIGH PRESSURE PIPE (ACCUMULATOR TO INJECTOR). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMKX	6/30/2015	10/30/2016	1209	298
4422	The OBD system may temporarily disable performing Fuel System monitoring (P0171/P0172) under certain driving conditions.	5/1/2018		33079	0
4423	The affected part number 16117341299 relates to the Fuel Tank Supply Module. Analyses have shown, that the component fuel tank supply module in general was replaced due to a software failure in the ECU (Engine Control Unit). In more detail: The component PT-sensor (pressure/temperature sensor) located inside of the fuel tank supply module is/was monitored also during driving conditions. This could lead to the scenario, that the PT-sensor shows an implausible value (e.g. temperature drop) due to contact with fuel and the OBD diagnostic detects the PT-sensor as malfunctioning (including the corresponding fault code and MIL Illumination) although the component PT-sensor is not malfunctioning. As a result the ?malfunctioning?? PT-sensor was replaced in services by replacing the complete fuel tank supply module. This means that in general the component fuel tank supply module was replaced without being malfunctioning. Beginning with July 2013, BMW has modified the ECU software so that the OBD diagnostics for component PT-sensor are only running during engine off time conditions to avoid the false failure detection and false MIL as described above.	6/30/2012	6/29/2013	0	0
4424	The affected part number 16117341299 relates to the Fuel Tank Supply Module. Analyses have shown, that the component fuel tank supply module in general was replaced due to a software failure in the ECU (Engine Control Unit). 	<p>The affected part numbers 13907614013 (used for model MINI Cooper Clubman) and 13907621174 (used for models MINI Cooper and MINI Convertible) relate to the FUEL TANK BREATHER VALVE. Analyses have shown, that in 100% of all cases one of the following two different hardware failures could cause the malfunctioning tank breather valve, which are both detected by the OBD system (fault code entry including MIL illumination). Failure #1 (Knobs failure mode): The rubber structure of the knobs pressed in the hole of the valve bumper could crack in the area between chamfer and hole and in the following could detach and get lost in the backside. Due to the missing rubber structure there is a metal to metal contact in the fuel tank breather valve, which could result in a blocked valve and could lead to a too lean fuel mixture, which is detected by the OBD. Failure #2 (Retractable membrane): Due to failures in the production process the retractable membrane (plastic material) of the non-return valve could brake completely. This malfunction could be caused either by an extruding failure or by a pre-damage of the membrane due to a ridge on the seatengaging surface of the anker. For vehicles with one fuel tank breather valve this malfunction (broken membrane) will be detected by the OBD as small leakage, for vehicles with two valve as a leakage of the second purge line.</p>	6/30/2015	6/29/2016	16499	4950
4420	<p>The affected part numbers 13907614013 (used for model MINI Cooper Clubman) and 13907621174 (used for models MINI Cooper and MINI Convertible) relate to the FUEL TANK BREATHER VALVE. 	<p>The affected part number 16127205307 relates to the REAR FUEL RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMX03.0N57, BMW decided a warranty extension to full vehicle life (10 years / 120.000mi). Please see corresponding EDIR-05-N57/N47-033.1 (will be submitted after the reporting threshold >45% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component REAR FUEL RETURN LINE is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298
4430	The affected part number 13537823395 relates to the FUEL LINE TO HIGH-PRESSURE PUMP. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. 4452	The warranty claims for the Electric Change-Over Valve in certain ML 250 BlueTEC 4MATIC, GLK 250 BlueTEC 4MATIC, E 250 BlueTEC, E 250 BlueTEC 4MATIC, and GLE 300 d 4MATIC vehicles are based on the following root cause: an internal leakage of the water pump resulting in water entering the underpressure chamber of the water pump through the permeable rod seal. This may result in			7715	68
	<p>The affected part number 13517588879 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services.</p> <p>Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump.</p> <p>Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can effect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL illumination).</p> <p>In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL illumination.</p> <p>In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.</p>

4456					
	<p>Calibration Concerns: Scan Tool Mode \$0A, this is a Non-erasable permanent DTCs (Mode \$0A) for fuel rail pressure monitoring. The issue was discovered during PVE [](2) testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC)</p> <p>Calibration Concerns: NbX-Sensor Rationality monitor, this is a NbX-Sensor out-of-range monitor without function (P2202, P2203, P22A0 and P22A1). The issue was discovered during PVE [](2) testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC)</p> <p>Calibration Concerns: Throttle Valve Rationality monitor: The issue was discovered during PVE [](2) testing and was reported to the agencies on May 7, 2018</p> <p>Calibration Concerns: Oxidation Catalyst (DOC) efficiency monitor. The issue occurs during high altitude driving conditions, requires replacement of the DOC (impacting durability), and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM</p> <p>Calibration Concerns: Boost system Rationality monitor. Boost system gross leakage monitor with limited function. The issue was discovered during PVE [](2) testing and was reported to the agencies on May 7, 2018</p> <p>Calibration Concerns: Engine Control Module (ECM) inhibit relations. Planned improvements of inhibit relations to avoid additional fault codes and ensure reliable guidance for service. The issue was discovered during PVE [](2) testing and was reported to the agencies on July 2, 2018.</p> <p>Calibration Concerns: Engine Control Module (ECM) Injection Limitation. Reduction of the fuel injection pattern at high ECM temperatures and low battery voltage. This issue has not caused customer complaints and is unlikely to occur in ordinary driving conditions. Fixing this issue does not require changing the AEM.</p> <p>Calibration Concerns: Service-Tester/Tools. Service base setting to adjust idle speed. This is a minor change designed for dealer diagnostics. It does not change the AEM calibration</p> <p>Calibration Concerns: Vehicle Drivability (Poor/Fuel Adaptation). Customer complaints regarding drivability during engine warm-up. The issue affects drivability of the vehicle, occurs during ordinary vehicle operation and use, and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM.</p> <p>Calibration Concerns: Reductant Supply Module, The SCR module is being replaced due to a false MIL condition resulting from high temperatures/diagnostic thresholds of consumption deviation monitor. The change will impact the AEM calibration, but the change is not required to fix this Technical issue. The proposed change is an improvement for the issue, but not a complete solution.</p> <p>GenerationModelMYCai (DCEU)TCU Gen 2.1 SUVQ720134L2910401A0012 AVABECU Gen 2.1 SUV Touareg20137P0907401K 0011 AVABECU Gen 2 PCA620144G0907401N 0013 BVABECU Gen 2 PCA720144G0907401N 0013 BVABECU Gen 2 PCA820144H0907401F 0013 BVABECU Gen 2 PCQ520148K907401J 0011 BVABECU Gen 2.1 SUVQ720144L2910401A0012 AVABECU Gen 2.1 SUV Touareg20147P0907401K 0011 AVABECU Gen 2.1 SUV Touareg20130C8927750AK 3398TCU Gen 2.1 SUV Touareg20140C8927750CF 3376TCU Gen 2 PCA6A720144G0927158AQ 1006/1008TCU Gen 2 PCA820144H1927158AN 1008TCU Gen 2 PCA820144H1927158CK 1006TCU Gen 2 PCQ52014 8R0927158Q 1007TCU</p>			3994	3994

	<p>The affected part numbers 51747497279 respectively 51137497285 and 51138091760 respectively 51748091762 relate to the components upper respectively lower air flaps (Active Grill Shutters).</p> <p>Please note that only the 7-Series models 750i xDrive (SWB), 750i and 750i xDrive and the 5-Series model M550i xDrive are equipped with active grill shutters. All other models included in model year 2018 test group JBMXJ04.4N63 have no active grill shutters built.</p> <p>The affected part numbers 51747497279 and 51137497285 for components upper and lower air flaps relate only to the 5-Series model M550i xDrive.</p> <p>The affected part numbers 51138091760 and 51748091762 for components upper and lower air flap relate only to the 7-Series models 750i xDrive (SWB), 750i and 750i xDrive.</p> <p>Analyses have shown that components lower and upper air flaps with part numbers 51747497279 respectively 51137497285 and 51138091760 respectively 51748091762 were replaced in about 95% of all cases due to a malfunction detected by the OBD system including fault code storage and MIL illumination (e.g. electrical failure of actuator, stuck shutter, shutter performance).</p> <p>There are two different failures which could cause these valid malfunctions:</p> <p>Failure#1 (about 85% of all valid failures): Contamination (mix of transmission oil, brush dust and copper abrasion) of the commutator (daubed commutator slit) leads to an increased current of the actuator so that this component fails.</p> <p>Failure#2 (about 15% of all valid failures): The kinematics /component 7spacer? (connecting element of the coupling bar between actuator and the shutters) could be unhinged or lost, so that the shutters could not be controlled/moved any more.</p>

4536	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2019	5/7/2019	63784	63784

4538	<p>The affected part number 13537823395 relates to the FUEL LINE TO HIGH-PRESSURE PUMP. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-N57/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded).</p> <p>In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL LINE TO HIGH-PRESSURE PUMP is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298
4539	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	6/30/2015	10/30/2016	1209	1209

	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">7Coolant loss with Check-Control-Indication7Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)7Smell of exhaust gas7Unusual noise from the engine compartment7Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740iL xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	7/31/2016	8/30/2017	1821	1821
	<p>The affected part number 36117343299 relates to the Fuel Tank Supply Module. Analyses have shown, that the component fuel tank supply module in general was replaced due to a software failure in the ECU (Engine Control Unit). In more detail: The component PT-sensor (pressure/temperature sensor) located inside of the fuel tank supply module is/was monitored also during driving conditions. This could lead to the scenario, that the PT-sensor shows an implausible value (e.g. temperature drop) due to contact with fuel and the OBD diagnostic detects the PT-sensor as malfunctioning (including the corresponding fault code and MIL illumination) although the component PT-sensor is not malfunctioning. As a result the malfunctioning PT-sensor was replaced in services by replacing the complete fuel tank supply module.</p> <p>This means that in general the component fuel tank supply module was replaced without being malfunctioning. Beginning with July 2013, BMW has modified the ECU software so that the OBD diagnostics for component PT-sensor are only running during engine off time conditions to avoid the false failure detection and false MIL as described above.</p> <p>4543 Some 2014~2016 model year Hyundai Elantra 2.0L, Elantra Coupe 2.0L and Kia Forte 2.0L may exhibit an issue with NMDS control that could lead to an exceeding of the emissions standards under a certain specific condition such as when the catalyst heating control is not activated. Hyundai has refined BMS data so that catalyst heating is entered to ensure the catalyst reaches the act</p> <p>4544 Some 2014~2016 model year Hyundai Elantra 2.0L, Elantra Coupe 2.0L and Kia Forte 2.0L may exhibit an issue with NMDS control that could lead to an exceeding of the emissions standards under a certain specific condition such as when the catalyst heating control is not activated. Hyundai has refined BMS data so that catalyst heating is entered to ensure the catalyst reaches the act</p> <p>4545 The PCV valve, an oil flow control device, may separate and allow engine oil to enter the combustion chamber. If the PCV valve separates and oil enters the combustion chamber, there may be a visible change in the appearance and/or amount of tailpipe exhaust, and if driving under this condition continues, separated component</p> <p>4546 Some 2011~2016 model year Kia Sportage 2.4L may exceed the ORVR standard. According to the investigation of canister manufacturing process/subpart/production history, an analysis indicates charcoal displacement occurs because defect sponge inside the canister has short length, so displacement occurs with the combination of charcoal being tilted and short sponge length. As a c</p>	6/30/2012	6/29/2013	0	0

4577	Some 2014*2017 model year Kia Rio 1.6L vehicles have experienced a customer complaint in which certain customers smell fuel inside while they are driving in the city, especially in Stop-and-Go mode at high ambient temperature. According to the investigation, Kia has found that there is a necessity of EMS purge data optimization at the high temperature condition to improve customer			34514	3
4578	Some 2019 MY 2.7L and 3.0L gasoline turbocharged direct injection (GTDI) vehicles were built with a positive crankcase ventilation (PCV) valve that was not intended for these applications, which can result in an increased risk of false malfunction indicator light (MIL) illumination.			34799	34799
4579	Due to improper Engine Control Module (ECM) programming, under certain circumstances, the ignition coil may be energized longer than designed after the engine is OFF. If the ignition coil remains energized for too long, the internal temperature of ignition coil may increase which could cause a short circuit and a blown fuse. If a s	4/17/2017	7/25/2018	207963	11
4580	Some 2010*2015 model year Hyundai Tucson 2.4L may exceed the ORVR standard. According to an investigation of canister manufacturing process/subpart/production history, Analysis indicates that the displacement of the charcoal occurs nearly immediately. Because the Defect sponge inside the canister is too short in length, so charcoal dislodging occurs with the combination of charcoal tilting and the short sponge length. As a countermeasure, a supplemental canister will be applied between the faulty canister and the Canister Close Valve (CCV) for those canisters that fail an inspection. Hyundai will add the 150cc auxiliary canister for the vehicles that fail an inspection through a voluntary service campaign (VERR) with customer notification.			12222	0
4581	Some 2010*2015 model year Hyundai Tucson 2.4L may exceed the ORVR standard. According to an investigation of canister manufacturing process/subpart/production history, Analysis indicates that the displacement of the charcoal occurs nearly immediately. 	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017.</p>	3/31/2014	3/30/2015	2345	2345

Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine in all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017).</p>	6/30/2016	6/29/2017	1654	1654
4602	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	1549	0
4603	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	1324	0
4604	<p>The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956.</p> <p>Analysis have shown, that the component has been replaced in about 31% up to 42% (depending on Test Group) due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats).</p> <p>In the other 58% up to 69% (depending on Test group) of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.</p>	2/28/2014	6/29/2015	11459	963

4606	Customer vehicles may exhibit a fuel smell and/or leak from the engine compartment. In rare cases, extended cranking may occur during engine start. This condition is the result of some direct fuel injector O-rings that may split under fuel pressure.			31361	31361

Daimler AG has determined that the soot particulate sensor could fail due to the following root causes: Root Cause A: Particles on the sensor element resulting from the manufacturing process. Root Cause B: Flaking of the electrode due to insufficient evaporation of humidity inside the sensor element. Both root causes lead to an electrical failure of the soot particulate sensor. In case of failure the Malfunction Indicator Lamp (MIL) is illuminated.

The conditions below are referenced from the following Field Fix documents: FF_DV2_0BSF_06_18 FF_DV2_03PA_10_18 FF_EV2_0BSF_13_18 FF_EV2_03PA_14_18 -Lambda Control, Dew Point End Conditioner Pre-Probe, and Quick Start after Catalyst Sensor: Event: NOx emissions above the FTP standard due to an inaccurately adapted second control loop ? a result of inhomogeneous exhaust gas distribution under certain engine load conditions affecting the lambda value expected by the ECM compared to the lambda value measured by the first lambda sensor. Solutions: (1) Correct the target lambda value for specific blocks within the fuel calibration map. (2) Enable quick start of the second lambda sensor, so the ECM can use its measured value as a secondary input sooner to modify the fuel mixture should it need to. Suction Tube Model: Event: Under certain conditions, after the start up overshoot, a small rpm diver may occur which can be noticed by customers.			2180	2180
4641 Solution: Previous analysis showed that there is a difference in take-off behavior between a break-through start and a normal start. Differences in the timing of the reset function during ignition-On resulted in incorrect values of the initialization variables, which are issues in the initial function for crankcase-ventilation function	7/28/2014	9/17/2015	6815	3
4642 Due to inappropriate calibration of the PCM, when a large amount of contamination adheres to the throttle body bore, the throttle valve may become stuck at the full closed position and the vehicle won't start. The MIL illuminates P2101 for "Throttle Actuator System Malfunction".	9/14/2014	8/17/2015	551846	62
4643 Due to inappropriate calibration of the PCM, when a large amount of contamination adheres to the throttle body bore, the throttle valve may become stuck at the full closed position and the vehicle won't start. The MIL illuminates P2101 for "Throttle Actuator System Malfunction".	12/15/2017	3/7/2018	1652	16
4644 Some 2018 MY Jeep® Renegade and Jeep® Cherokee equipped with a 2.4L engine (sales code ED6 or ED8), Fiat 500X equipped with a 2.4L engine (sales code ED8), and Jeep® Compass equipped with a 2.4L engine (sales code ED6, ED8, or EDE) vehicles may experience a Malfunction Indicator Lamp (MIL) illumination, P2226 baromet	12/15/2017	3/7/2018	1652	16

4646 Some 2018 MY Jeep® Renegade and Jeep® Cherokee equipped with a 2.4L engine (sales code ED6 or ED8), Fiat 500X equipped with a 2.4L engine (sales code ED8), and Jeep® Compass equipped with a 2.4L engine (sales code ED6, ED8, or EDE) vehicles may experience a Malfunction Indicator Lamp (MIL) illumination, P2226 baromet	12/15/2017	3/7/2018	1652	16
4647 In affected vehicles, if the engine coolant temperature is below 60 degrees C, spark is retarded. Under these conditions, if the vehicle is driven with repeated throttle back-outs, misfires are induced which overheat the catalyst. Over time, these set of conditions will result in catalyst damage with MIL illumination and Low Catalyst Efficiency DTC.			3405	340
4648 In affected vehicles, if the engine coolant temperature is below 60 degrees C, spark is retarded. Under these conditions, if the vehicle is driven with repeated throttle back-outs, misfires are induced which overheat the catalyst. Over time, these set of conditions will result in catalyst damage with MIL illumination and Low Catalyst Efficiency DTC.			1101	110
4649 The engine Malfunction Indicator Lamp (MIL) may be illuminated with Diagnostic Trouble Codes (DTC) flagging a problem with the Valve-Fuel Vapor Purge. 98% of the parts investigated were no-fault-found. The remaining 2% of the parts investigated had failed due to cracking of the valve as a result of extreme vehicle driving maneuvers causing stress on the valve. 95 of the 98% of the no-fa			18067	108
The affected part number 13537823400 relates to the FUEL RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMT03.0N37, BMW decided a warranty extension to full useful life (10 years / 120.000mi). Please see corresponding EDIR-GF-N57/N47-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RETURN LINE is/was working properly and has/had no malfunction.	7/31/2014	6/30/2015	7396	908
The affected part number 13538506546 relates to the HIGH PRESSURE PIPE (ACCUMULATOR-TO-INJECTOR). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMT03.0N37, BMW decided a warranty extension to full useful life (10 years / 120.000mi). Please see corresponding EDIR-GF-N57/N47-0267. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component HIGH PRESSURE PIPE (ACCUMULATOR-TO-INJECTOR) is/was working properly and has/had no malfunction.	7/31/2014	6/30/2015	7396	908
Thermostat Inserts (partNs: 9A110622602, 9A110622603) are being replaced in the field for illuminating the MIL. Fault P2181 is usually stored. Various root causes were found: Residual dirt in the cooling system. Spring force too low. Frictional resistance between the heating pin and sealing body. Wax element defective.

	Q	R	S	T	U
4666	<p>The part numbers 11157601453, 11158635843 and 11158647299 relate to the vent hose connecting line. Part number 11157601453 with index 03 has been used in production between 07/12 and 09/13. Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	6/30/2012	6/29/2013	39763	2400

	<p>The part number 13518573162 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY15 Diesel models with 6 cylinder engine N57 (Test Groups FBMXV03.0N57 and FBMXT03.0N57). Beginning with 12/2016 a more robust hardware with part number 13518597821 was introduced in production and as replacement part in service.</p> <p>The part number 13518571796 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY15 Diesel models with 4 cylinder engine N47 (Test Groups FBMXV02.0N47 and FBMXT02.0N47). Beginning with 12/2016 a more robust hardware with part number 13518597819 was introduced in production and as replacement part in service.</p> <p>Analysis (applying to the original built part numbers 13518573162 and 13518571796 for component high pressure fuel pump Diesel) have shown that regional varying gasoline quality have a great impact on the mechanical deterioration of the component high pressure pump.</p> <p>In worst cases a lower quality could lead to a break down respectively to mechanical cuttings of the high pressure pump track roller. Those metal warfs could float through the entire fuel system (e.g. high pressure/low pressure system and tanks) and accumulate anywhere. Such a contaminated system could not provide the necessary rail pressure at engine start (causing a non-starter) respectively could lead to a limp home mode including a performance reduction. OBD system will identify those malfunctions and trigger a fault code storage with MIL illumination. The replacement of the high pressure fuel pump has been in all cases the right measure to repair the malfunction.</p> <p>46/75</p>	6/30/2014	6/29/2015	3695	382
	<p>A customer may report the malfunction indicator lamp (MIL) is illuminated, lack of power and sometimes noise coming from the engine bay. The stored diagnostic trouble code (DTC) points to "turbocharger under-boost" which results from a failure of the Turbo-Exhaust Manifold.</p> <p>46/76 Jaguar Land Rover introduced a brazed scroll manifold which at high time in service is starting to disintegrate. The root cause being a combination of thermal fatigue and vibrations which will make the joints loose.</p>			18201	6370
	<p>Customer Complaint: MIL on, vibration, and engine compartment noise</p> <p>Component: Catalytic Converter Support Bracket</p> <p>Production Part Number (Catalyst): 7P0 254 301 CX</p> <p>Part analysis reflects part number: 7P0 254 301 CX</p> <p>46/77 Due to improper positioning of a welding pool, the weld load-bearing cross-section could be too thin, which could lead to a crack in the Catalytic Converter support bracket to crack. This condition is specific to the catalyst support bracket on the passenger side of vehicle only, cylinders 4-6. Prior to this improvement, catalytic converter replacements were consequentially replaced due to the bracket concern described above.</p>			5468	5468
	<p>The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before. Analysis have shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15.</p> <p>The component vent pipe PCV with part number 11158647961 therefore is robust, has/ had no malfunction and is/ was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.</p> <p>46/78</p>	6/30/2012	5/31/2013	39763	2400

	<p>The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before. Analysis have shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements. Complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15. The component vent pipe PCV with part number 11158647961 therefore is robust, has/ had no malfunction and is/ was working properly. Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.</p>	6/30/2012	5/31/2013	39763	2400
	<p>Some 2015-2018MY 1.4L FIAT Spider Convertible (7BA7?), Jeep Renegade (7BU7?), FIAT 500 (7FF?), FIAT 500X (7FB?), FIAT LO (7BG?), FIAT 500L (7BF?) and 2018 2.0L Alpha Giulia (7GA?), Alpha Stelvio (7GU?) vehicles that entered commerce may have a calibration that inadvertently suspended some required On-board Diagnostic (POBD?) monitors when the P107F fault code is set.</p> <p>This issue occurred when the powertrain control software was modified to correct an issue related to the P107F code inadvertently setting during uncommon conditions (i.e. low battery voltage, etc.) and resulting in nuisance Malfunction Indicator Light (7MIL?) faults. The resulting 7fix? (making P107F a non-MIL code) inadvertently resulted in additional OBD-related issues. In particular, analysis revealed that the P107F Diagnostic Trouble Code (7DTC?) would suspend the catalyst monitor, upstream O2 monitor, and upstream closed loop control.</p>			293	293

	<p>4685 In certain vehicles the hybrid drive motor battery cell pouches may leak electrolyte internally in the battery pack. This can cause a loss of cell voltage and reduced battery pack capacity. The leak is likely a result of moisture in the air that enters the battery pack vent and interacts with internal components. Incidents of such leaks have been identified primarily in hot and humid states. Ad</p> <p>4686 The Engine Control Module (ECM) in certain vehicles was manufactured with a circuit board that was not properly cleaned during circuit board manufacturing. Contamination on the circuit board may cause failed solder joints or open circuits in the traces of the circuit board. The defect is limited to one lot of circuit boards.</p>			18	0

	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.				
4689	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			8818	0
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.				
4690	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			2194	0
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in regions with high ambient temperatures (±100 deg. F). The vehicles are able to be restarted.				
4691	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in extreme hot weather conditions. When this occurs, excess gas enters the engine causing the engine to run rich and hesitate/stop.			1923	0
4692	Some 2015 2.7L gasoline turbocharged direct injection (GTDI) vehicles were built with a fuel vapor hose assembly where the vapor blocking valve (VBV) can become stuck open or stuck closed due to sub-standard clearance between the moving plunger and a stationary core.			32921	3559
4693	Fuel tank isolation valves, part number 95820155900, are being replaced in the field for MIL illumination and because the vehicle cannot be filled with fuel. A valve that sticks closed will not allow the fuel vapors to vent properly when refueling. Most frequent faults stored when the MIL is illuminated are P30DC00 and P242100.			187	27
4694	Fuel tank isolation valves, part number 95820155900, are being replaced in the field for MIL illumination and because the vehicle cannot be filled with fuel. A valve that sticks closed will not allow the fuel vapors to vent properly when refueling. Most frequent faults stored when the MIL is illuminated are P30DC00 and P242100.	6/17/2015	5/18/2016	2553	38
	Some 2014-2016 MY Jeepz Grand Cherokee and RAM 1500 vehicles equipped with a 3.0L diesel engine are experiencing DOC/DPF replacements. The Malfunction Indicator Lamp (MIL) illuminates. The majority of the diagnostic trouble codes on the vehicle at the time of part replacement were P2463 (DPF soot accumulation) and P2002 (DPF efficiency below threshold). P1030 (oil viscosity) and P0420 (catalyst efficiency-bank 1) were present to a lesser extent.				
	FCA US LLC engineering reviewed 2014-2016 model year U.S. market claims for DOC/DPF replacement to assess causal factors on a larger population to ensure statistical significance. Of those, 27% had no related diagnostic trouble codes (DTC??) or information to determine why the DOC/DPF was replaced. The remaining claims revealed the following:				
	-13% of DOC/DPF assemblies were replaced due to damage to the mounting studs (broken/tripped) when attempting to replace the SCR catalyst or repair an exhaust leak at the bolted joint. There was no indication of a DTC or other issue with the DOC/DPF.				
	-57% of the DOC/DPF assemblies were replaced due to the presence of DTC P2463 or P2002. Most of the claims has a service regeneration attempted and failed prior to part replacement. In May 2018, FCA revised the WiTech service tool software to ensure that the Technician would correct any existing DTCs that would prevent the service regeneration from running properly. Since the WiTech software update, 77% of the vehicles were confirmed repaired with the service regeneration and did not require a DOC/DPF replacement.				
	Based on this analysis it likely that 87% of the DOC/DPF replacements had issues with effectiveness DOC/DPF catalyst. The majority of the claims are associated with the level of soot present on the catalyst for which the attempt at a service regeneration was not effective.				
4695				40403	915
	Customer Complaint: MIL on, and whistling sound from engine compartment. Component: PCV Valve/Oil Separator Production Part Number: 0791035428 Warranty Replacement Part Number: 079103542E DTC present: - P2197 (Intake Air System Leak - adaption valve monitoring) - P0507 (Idle Control System - RPM Higher than expected)				
	Analysis reflects part number 0791035428				
4696	Analyzed components showed a cracked membrane and/or broken check valve within the module of crankcase ventilation system.			4827	262
4697	DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			5566	61
4698	DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			15006	1204
4699	DAG has determined that insufficient robustness with regard to environmental impacts, such as increased moisture, could lead to electrical failures of the differential pressure sensor. As a result, the fault is stored in the engine control unit and the engine diagnostics warning lamp (MIL) is activated.			4279	353
4700	Some MY18 Nissan Kicks and MY18.5 Rogue Sport vehicles used an incorrect format on the A/C flammable refrigerant warning label for R1234yf. The label listed charge amounts to two significant digits rather than three as required by SAE J639 (0.XX kg?? instead of 0.XXX kg??). All charge amounts, however, were correct.	12/17/2017	7/3/2018	36492	36492
	Crankshaft speed sensors (part number 95860643300) are being replaced in the field for MIL illumination. Fault code P0322 is most frequently stored.				
4701	Analysis shows that a poor solder joint in the connector area leads to premature failure through heat and vibration.			2025	114
	The affected part number 16117243972 relates to the FUEL PUMP [DELIVERY MODULE]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2015 Test Group FBMV02.0N47, BMW decided a warranty extension to full useful life (10 years / 120.000mi) (please note that the corresponding FIR (equivalent to FIR F-0E 2.0-9) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL PUMP [DELIVERY MODULE] is/was working properly and has/had no malfunction.

4722	Due to a logistic failure, the wrong fuel delivery module (located inside the fuel tank) could be installed by the supplier (e.g. delivery module with an outlet for auxiliary heating system, but no auxiliary heating system as an additional hardware installed). As a result the correct supply pressure could not be reached. If the pressure is too high a noise issue or fuel entry in the crankcase could be possible. If the supply pressure is too low an engine stalling could be possible. In these cases, where the delivery module has an outlet for an auxiliary heating system but no auxiliary heating system as an additional hardware is installed, the outlet is covered with a dust cover. Since this area of the system (adapter) has atmospheric pressure, it is expected the component duct cover could be lost only in few cases after a higher mileage. Only in these cases a leakage would be possible which could result in a fuel emission (dropwise). It is expected, that in about 684 vehicles (models 5 Series, 6 Series and 7 Series with different engines (e.g. 4-cylinder engine B46, 6-cylinder engine B58 and 8-cylinder engine N63))the wrong fuel delivery module could be installed in production period 07/2015 through 03/2018.	6/30/2015	5/31/2016	44	44

4734	On certain vehicles P2004 (Intake manifold runner functional performance bank 1) and P2008 (intake manifold runner functional performance bank 2) DTCs are set when the swirl valves do not respond appropriately to an ECM command. This results in the illumination of the malfunction indicator lamp. When this occurs, swirl valve closed loop functionality is disabled, the valve is set to			32073	9
4735	On some 2016 Infiniti Q50 vehicles (B OL V6), customers are experiencing an engine misfire or rough running condition with associated MIL Illumination (DTC P0301-P0306). Infiniti has investigated and found that the fuel injector may possibly become stuck open due to the potential presence of burrs left behind in the fuel supply)	10/20/2015	7/25/2016	15819	69
4736	In certain vehicles a performance fault may occur in the fuel injector control circuits internal to the Engine Control Module (ECM). This is typically caused by an ECM component failure. These faults cause the MIL to illuminate and typically limit fuel injector function.			23242	25
4737	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	9/18/2017		2291	0
4738	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	7/25/2016		49404	31
4739	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	8/2/2017	10/3/2017	31406	8
4740	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	7/28/2016	10/3/2017	42097	27
4741	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	8/2/2017		23920	6
4742	Due to inappropriate calibration of the PCM and TCM, engine oil may be diluted with fuel when short trip driving operation is repeated during winter season in cold weather (low engine oil temperature condition). After that, when fully warmed up the diluted fuel in the engine oil may evaporate rapidly and the MIL may illuminate.	6/2/2017		23919	6
4743	When operating under certain conditions involving high altitude and temperature, the vehicle may experience DTW P3190 (Poor Engine Power) and reduced internal combustion engine power. In this condition, the vehicle will illuminate the check engine light and may enter an EV/fail-safe mode if the internal combustion engine shuts down.			5738	5738
4744	Some 2019 MY Jeep Cherokee (XKL?) vehicles equipped with a 2.4L engine (sales code EDE) may have a VECI label that contains incorrect information including the wrong EPA and CARB emission standard.			1539	1539
4745	On some MY2018 Nissan Murano vehicles , a material handling error resulted in MY2017 VECI labels being installed in error.	7/30/2018	8/3/2018	42	42
4746	The affected part number 13S1B604232 relates to the component HIGH PRESSURE FUEL PUMP. Analysis have shown that in about 81% of all cases the high pressure pump has been replaced due to a correct fault code entry and MIL illumination identifying the malfunction of that specific component. Deterioration of gasoline filter materials emitting small filter particles, lead to a blockade of the high pressure valve. The deterioration of the gasoline filter could be traced back to high temperature conditions and low gasoline quality respectively inadequate gasoline additives. Beginning with 12/2015 a new filter material (PREK?? instead of PA) for the filter was introduced in

	Q	R	S	T	U
	<p>The affected part number 13518604232 relates to the component HIGH PRESSURE FUEL PUMP. Analysis have shown that in about 81% of all cases the high pressure pump has been replaced due to a correct fault code entry and MIL illumination, identifying the malfunction of that specific component. Deterioration of gasoline filter materials emitting small filter particles, lead to a blockade of the high pressure valve. The deterioration of the gasoline filter could be traced back to high temperature conditions and low gasoline quality respectively inadequate gasoline additives. Beginning with 12/2015 a new filter material (PEEK?? instead of PA) for the filter was introduced in production and services.</p>	2/28/2014	5/31/2015	11445	1259
	<p>Daimler AG has determined that in the affected vehicles a plausibility error of the temperature sensor within the power electronics could be detected erroneously, although the system works properly. In this case, the check engine warning lamp (MIL) would be activated falsely.</p>	5/31/2016	5/30/2017	499	499
	<p>Some 2014-2017 MY Jeep® Grand Cherokee and Ram 1500 vehicles equipped with a 3.0L diesel engine are experiencing ERG cooler replacements. FCA US analyzed 2863 warranty claims throughout the United States from MY 2014-2017 and found the following results:</p> <p>72091 (73 %) had an internal leak in the EGR cooler. 7457 (16%) had a plugged or restricted EGR cooler due to soot. 7108 (3.7%) had an EGR bypass that was stuck or broken. 7106 (3.70%) had an issue with an adjoining component 751 (1.78%) had an external EGR cooler leak 750 (1.75%) had an unknown failure not related to the EGR cooler</p>			32075	1047

	<p>Some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module.</p> <p>AFCA US review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules.</p> <p>The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start.</p> <p>4752 Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.</p>			956	66
	<p>-Complaint: Not Applicable -Component: Transmission Control Software Calibration -Production Part Numbers: N/A -Replacement Part Number: See table Certified calibrations, applicable to the model year, test group, and model will be defined and applied to vehicles within the affected populations defined in the family and model details section. -DTCs Present: Not Applicable -Analysis reflects part numbers (Software calibrations): 02E300012W_2099 02E300057Q_3119 02E300058N_3501 02E300058N_3504 02E300058N_3512 02E300058N_3520 02E300062K_4002 0CG300045F_5303 0CG300045F_5308 0CG300045G_5801 02E300057R_3114</p> <p>-Analysis: During an internal review, VW recognized that due to a quality slip, incorrect TCM Software Calibrations were released to the field with Mode A concerns.</p> <p>Of the affected 301 Model Year 2013 7 2014 vehicles, 286 vehicles are represented by 3 of the 7 Test Groups reported; the remaining 4 Test Groups have 9 or less vehicles.</p> <p>4758</p>			4	4
	<p>The affected part numbers 51137497285, 51747497279, 51748091762 and 51138091760 relate to the Lower and Upper Air Flaps (Active Grill Shutters). Analyses have shown that these components were replaced in about 95% of all cases due to a malfunction detected by the OBD system including fault code storage and MIL illumination (e.g. electrical failure of actuator, stuck shutter, shutter performance). There are two different failures which could cause these valid malfunctions:</p> <p>Failure#1 (about 85% of all valid failures): Contamination (mix of transmission oil, brush dust and copper abrasion) of the commutator (daubed commutator slit) leads to an increased current of the actuator so that this component fails. Failure#2 (about 15% of all valid failures): The kinematics /component ?spacer? (connecting element of the coupling bar between actuator and the shutters) could be unhinged or lost, so that the shutters could not be controlled/moved any more.</p> <p>4759</p>	6/30/2016	5/31/2017	5037	1914

4777	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? 4704	The affected part number 13537620946 relates to component FUEL HIGH PRESSURE SENSOR. The fuel high pressure sensor with this part number is used in all models included in model year 2013 test group DBMXYD4.4NE3 except the S Series models 550i and 550i xDrive where another hardware (different pressure sensor with diff	6/30/2012	6/29/2013	17280	1037
4705	Daimler AG has determined that on certain S-Class (platforms 217 and 222) vehicles in one special use case the software might detect a misfire even when no misfire occurred. The issue only occurs when driving down a hill while catalyst heating may be necessary (about max. 60 seconds after cold start of the engine). In this case, the Malfunction Indicator Lamp (MIL) would erroneously			30470	4
4706	Daimler AG has determined that on certain C-Class vehicles (205 platform) the scantool output of the in-use performance ratio of the tank leak diagnosis could be incorrect due to a software error. In case of the described defect, the scantool output of the in-use performance ratio is always zero, although the diagnosis system works properly.			2	0
4707	Daimler AG has determined that on certain C-Class vehicles (205 platform) the scantool output of the in-use performance ratio of the tank leak diagnosis could be incorrect due to a software error. In case of the described defect, the scantool output of the in-use performance ratio is always zero, although the diagnosis system works properly.			1013	0
4708	Daimler AG has determined that certain E-Class (platform 213 and 238) and S-Class (platform 217 and 222) vehicles experience a software error. In case of a switch off of the onboard electrical system supply by the discharge protection system, OBD diagnosis information (e.g. fault codes) of the current driving cycle might not be stored. The customer will not receive an advance warning du			3383	0
4709	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.			536	1
4790	Daimler AG has determined that certain M-Class (platform 167), C-Class (platform 205), CLS-Class (platform 257), E-Class (platform 213 and 238) and S-Class (platform 217 and 222) experience a software error. In case of the described defect, stored faults could be deleted prior to completion of a full driving cycle. As a result the MIL might not be activated.			43	0
4791	<p>Daimler AG has determined that on certain GLE-Class (platform 166), SL-Class (platform 172), C-Class (platform 204), E-Class (platforms 207, 212), S-Class (platforms 216, 217, 221, 222), CLS-Class (platform 218), SL-Class (platform 231), R-Class (platform 251), GLC-Class (platform 253), G-Class (platform 463) vehicles with 4-, 6- and 8-cylinder gasoline engines catalyst heating might not be active in one special use case. The issue only occurs when the following unusual circumstances occur in combination:</p> <p>The engine is turned off after a driving cycle where it was fully warmed up. At the next engine-start / driving cycle the engine is started and turned off after no more than 2 seconds of operation. At the subsequent engine start / driving cycle catalyst-heating is not activated.</p> <p>In this case, due to a delayed heating up of the catalyst, an impact on emissions cannot be ruled out.</p>			36869	0

Daimler AG has determined that certain MY12-18 vehicles of diverse platforms could experience a software error. If a shortcut occurred within the injector while the engine was switched off, the failure code for this short cut would not be stored and the MIL would not be activated. However, in case of a confirmed shortcut, the MIL would be activated by a subsequent failure mechanism (misfire detection) and the workshop would replace the correct part. Based on a field claim analysis of potentially affected vehicles worldwide, the probability of occurrence of the described failure is lower than 0.00018 %.			668	0

The affected part number 13538508084 relates to the FUEL FEED LINE (TO HIGH PRESSURE PUMP). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMXT03.0N57,	7/31/2016	7/31/2017		
The affected part numbers 16117494926 relate to the MIDDLE FUEL FEED LINE #1 and #2. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMTX03.0N57, a final decision based on the final analysis results is expected in 01/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mls; equivalent to EDIR-0E-N57-0177) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). In case the high pressure fuel pump is pre-damaged or already malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mls). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component MIDDLE FUEL FEED LINE #1 and #2 is/was working properly and has/had no malfunction.	7/31/2016	7/31/2017	2614	544
The affected part number 16117494926 relates to the FUEL PUMP [DELIVERY UNIT W/ FUEL LEVEL SENSOR LEFT]. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2017 Test Group HBMTX03.0N57, a final decision based on the final analysis results is expected in 01/2019 (e.g. if a warranty extension to full useful life (10 years / 120.000mls; equivalent to EDIR-0E-N57-0177) or any other measurement (as e.g. a service campaign with replacement of component high pressure fuel pump at next service visit) will be decided). 	<p>The part number 13518573162 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY16 Diesel models with 6 cylinder engine N57 (Test Groups GBMX03.0N57 and GBMX03.0N57). Beginning with 12/2016 a more robust hardware with part number 13518597821 was introduced in production and as replacement part in service. The part number 13518571796 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY16 Diesel models with 4 cylinder engine N47 (Test Groups GBMX02.0N47 and GBMX02.0N47). Beginning with 12/2016 a more robust hardware with part number 13518597819 was introduced in production and as replacement part in service. Analysis (applying to the original built part numbers 13518573162 and 13518571796 for component high pressure fuel pump Diesel) have shown that regional varying gasoline quality have a great impact on the mechanical deterioration of the component high pressure pump. In worst cases a lower quality could lead to a break down respectively to mechanical cuttings of the high pressure pump track roller. Those metal warfs could float through the entire fuel system (e.g. high pressure/low pressure system and tank) and accumulate anywhere. Such a contaminated system could not provide the necessary rail pressure at engine start (causing a non-starter) respectively could lead to a limp home mode including a performance reduction. OBD system will identify those malfunctions and trigger a fault code storage with MIL illumination. The replacement of the high pressure fuel pump has been in all cases the right measure to repair the malfunction.</p> <p>4817 The lower lid within the fuel filler neck of the cap less unit does not close properly.</p>	6/30/2015	6/29/2016	1792 41	209 41
	<p>019MY G90 and G80 vehicles equipped with 5.0L GDI engine may experience an issue that the collected readiness data of the fuel system is not indicated as being "completed" even though the fuel system monitoring is actually been completed. According to the investigation, the main cause is an inappropriate ECU data calibration when it comes to indicating the completion.</p>			416	2
	<p>The affected part number 11658600045 relates to the turbo charger. In 45% of all cases the turbo charger has to be replaced because insufficient crankcase vacuum leads to an improper oil drain which in return disables the turbo charger. In the other 55% replacement cases no MIL has been illuminated and no corresponding fault code has been stored to verify that the component has been malfunctioning.</p>	6/30/2014	5/31/2015	20077	488

4821	The affected part number 11658600045 relates to the turbo charger. In 45% of all cases the turbo charger has to be replaced because insufficient crankcase vacuum leads to an improper oil drain which in return disables the turbo charger. In the other 55% replacement cases no MIL has been illuminated and no corresponding fault code has been stored to verify that the component has been malfunctioning.	6/30/2014	5/31/2015	20077	488
4822	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, (permanent) DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/vehicles the locking of ECM is not active.	2/28/2018	6/29/2019	2527	2527
4823	Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW/MINI vehicles with Bosch Engine Control Module MEVD17.2.3 produced between 03/01/2018 by 07/31/2018. Failure description: The locking of the ECM is implemented to avoid the manual deleting of permanent diagnostic trouble codes (DTC). If the locking is not active, (permanent) DTCs could be deleted manually with a diagnostic tool. In the affected ECMs/vehicles the locking of ECM is not active.	2/28/2018	2/27/2019	6144	6144
4824	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	4/11/2017	3/22/2018	20451	0
4825	The OBD system may falsely detect a malfunction of the P0716 "Input speed sensor performance check" in a certain condition.	6/20/2016	12/4/2017	129467	58
4826	The affected part number 11538674895 relates to the Thermostat (including a map controlled heating element). This component has been used beginning with 07/2016 in production. It also has been used in service since 07/2016 as replacement part, whenever a component with part number 11537647751 used in production by 06/2016 was malfunctioning. Analysis have shown, that in about 100 percent of all cases for model year 2016 models listed above, the originally built thermostat (11537647751) was replaced due to a disconnected pin of the heating element caused by corrosion due to moisture ingress in the thermostat housing. The corrosion leads to an increased power resistance of the connecting (pin), which is detected by the OBD system including fault code storage and MIL illumination. After this thermostat malfunction is detected (confirmed), the thermostat is still mechanical controlled (wax elements melts due to rising engine cooling water temperature and not map controlled by the heating element anymore) as a conventional thermostat. The succeeding built in thermostat (11538674895) didn't show significant numbers of malfunctions as pre described and so could be handled as a robust hardware. The Weibull and valid failure values reported in this document for test group GBMKV01.6N18 and part number 11538674895 relates therefore to the build thermostat with part number 11537647751. Component with part number 11538674895 is a robust hardware and itself has/had no malfunction, but was/is working properly.	6/30/2015	10/30/2016	13901	4782

4854	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2018	2/27/2019	5792	5792

4868	<p>The affected part number 13538596875 relates to the FRONTHP PUMP-TO RAIL FUEL LINE (PRESSURE HOSE ASSY). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMX703.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (please see EDIR-01-NS7-0325). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FRONTHP PUMP-TO RAIL FUEL LINE (PRESSURE HOSE ASSY) is/was working properly and has/had no malfunction.</p>	8/31/2017	7/30/2018	3366	552
4869	<p>The affected part numbers 51137497285 and 51137497280 relate to the Lower and Upper Air Flaps (Active Grill Shutters). Analyses have shown that this component was replaced in about 95% of all cases due to a malfunction detected by the OBD system including fault code storage and MIL illumination (e.g. electrical failure of actuator, stuck shutter, shutter performance). There are two different failures which could cause these valid malfunctions: Failure#1 (about 85% of all valid failures): Contamination (mix of transmission oil, brush dust and copper abrasion) of the commutator daubed commutator slit) leads to an increased current of the actuator so that this component fails. Failure#2 (about 15% of all valid failures): The kinematics / component 7apacer7 (connecting element of the coupling bar between actuator and the shutters) could be unhinged or lost, so that the shutters could not be controlled/moved any more.</p>	2/28/2017	6/29/2018	9940	1770

	<p>Originally FCA US reported that on some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module. An extended warranty is being provided which will cover 2011-2016 MY Dodge Charger (Pursuit) vehicles equipped with sales code AHB - Police Group. AFCA US review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules. The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start. Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.</p>			1381	1381

4899	Certain vehicles may have a condition which affects the electrical connections to the vehicle's accelerator pedal position sensors. Electrical connection to these sensors may be lost at times, intermittently. This is caused by dimensional variation in the pedal sensor housing that can allow the sensor's electrical terminal buck to move relative to the sensor's circuit board.			6544	55
4900	Some 2016-2017 Jeep Compass/Patriot (MK) vehicles with a 2.4L engine (ED3) and automatic transmission (D44) may have a Transmission Range Sensor (TRS) that will set a MIL and DTC Codes P0705 (TRS A Circuit (PRNDL Input) and/or P0706 (TRS Performance), due to a terminal flatness issue on the sensor.			2437	5

4931	On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020?? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).	5/1/2017	4/30/2018	9612	0
	<p>On certain six-cylinder diesel GL/ML/S 350 BlueTec vehicles, the clean air line could have failed due to signal range check faults. These could be caused by incorrect reinstallation of the connectors of the air mass flow sensor and temperature sensor during repair and maintenance work on various components that require the installation and removal of the clean air line. The air mass flow sensor and temperature sensor are part of the clean air line.</p> <p>This leads to deviation of range of the measured air mass and air temperature to the calibration. The deviation will result in illumination of the Malfunction Indicator Lamp (MIL), prompting the driver to visit a servicing dealer. In this case, an emission influence is not expected. The incorrect reinstallation is a deviation from our work instruction.</p>			9946	872

4950	The affected part number 16117361966 relates to the FUEL PRESSURE-TEMPERATURE SENSOR. Analysis have shown that this component has been replaced in 100% of all cases correctly. The reason for required replacements could be identified in inadequate production process causing an incorrect setup of the sensor housing. Ge	6/30/2016	4/29/2017	3250	2958
	<p>During an internal review, VW recognized that due to a quality slip, incorrect ECM/TCM Software Calibrations were released to the field.</p> <p>Analysis determined software list above calibrations within this report have one of the following concerns:</p> <p>-Mode A deactivated - TCM Software Calibrations were released to the field with Mode A concerns.</p> <p>-OBD Phase in - OBD Phase in requirements in MY14 might not be met</p> <p>No Information Available - Unique software on a low number of vehicles that are not possible to analyze</p> <p>-Possible CO2 Impact - Software designed and certified for a model year but that was then applied to a different model year without a field fix. It's possible that CO2 values may differ between the model years</p> <p>-Pre-series software installed - Vehicles with pre-series software in the field</p> <p>Production Software Replacement Software - Test Group 8V0906259K_00018V0906259H_0002ECMFGVGA02.0AJA 0D9300012_49050D9300012_4939TCMFGVGA02.0AJA 0D9300012_49120D9300012_4939TCMFGVGA02.0AJA 8V0906259K_00018V0906259H_0002ECMFGVGA02.0AJA 0D9300018B_S2020D9300013C_4905TCMFGVGA02.0APA 5G0906259L_00015G0906259D_0004ECMFGVGA02.0APA 5G0906259L_00023G0906259D_0004ECMFGVGA02.0APA 4G5907115A_4304G5907115A_0003ECMFGVGA02.0AAC</p>			30	30

	Some 2014+2016 model year Hyundai Elantra 2.0L, Elantra Coupe 2.0L and Kia Forte 2.0L may exhibit an issue with NMOG control that could lead to an exceeding of the emissions standards under a certain specific condition such as when the catalyst heating control is not activated. Hyundai has refined EMS data so that catalyst heating is entered (to ensure the catalyst reaches the acti				3214	1
	Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter. 1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning. 2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.				4243	7
	The affected part number 13538506546 relates to the FUEL RAIL-INJECTOR FUEL LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils.) Please see corresponding EDIR-OG-N57/N47-0311.) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer) due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component FUEL RAIL-INJECTOR FUEL LINE is/was working properly and has/had no malfunction.	6/30/2015	10/30/2016		1209	298
	The OBD system may temporarily disable performing Fuel System monitoring (P0171/P0172) under certain driving conditions.	5/1/2018			33079	0

The affected part numbers 13907614013 (used for model MINI Cooper Clubman) and 13907621174 (used for models MINI Cooper and MINI Convertible) relate to the FUEL TANK BREATHER VALVE. Analyses have shown, that in 100% of all cases one of the following two different hardware failures could cause the malfunctioning tank breather valve, which are both detected by the OBD system (fault code entry including MIL illumination). Failure R1 (Knobs failure mode): The rubber structure of the knobs pressed in the hole of the valve bumper could crack in the area between chamfer and hole and in the following could detach end get lost in the backside. Due to the missing rubber structure there is a metal-to-metal contact in the fuel tank breather valve, which could result in a blocked valve and could lead to a too lean fuel mixture, which is detected by the OBD. Failure R2 (Retractable membrane): Due to failures in the production process the retractable membrane (plastic material) of the non-return valve could brake completely. This malfunction could be caused either by an extruding failure or by a pre-damage of the membrane due to a ridge on the seat engaging surface of the anker. For vehicles with one fuel tank breather valve this malfunction (broken membrane) will be detected by the OBD as small leakage, for vehicles with two valves as a leakage of the second purge line.	6/30/2015	6/29/2016	16499	4950
DAG has determined that insufficient robustness of the exhaust gas temperature sensor with regard to vibration and thermal shock could lead to electrical failures. Vibration or thermal shock might lead to delamination of the conduction, loss of adhesion of the chip in the measuring tip, fracture of the ceramic or disruption of the cement seal. As a result, a fault is stored in the engine control module.			3572	32
Daimler AG has determined that certain GLE- and GLS-Class vehicles (166 and 292 platforms) might have been equipped with incorrect catalytic converters due to limitations on part inventory management systems in place at the relevant plant. In this case, the vehicles might not comply with the certified configuration in the COC application and/or applicable emissions standards. This may affect the vehicle's compliance with the relevant regulatory requirements.			4	4
The affected part number 16127205307 relates to the REAR FUEL RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-N57/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded). 	<p>The affected part number 13517588679 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services.</p> <p>Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump.</p> <p>Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can effect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL Illumination).</p> <p>In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL Illumination.</p> <p>In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.</p> <p>5009</p>	6/30/2011	6/29/2012	1048	435

5037	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2010	5/31/2011	6120	6120
5038	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.	6/1/2011	5/31/2012	6331	6331

5044	Due to inappropriate PCM software, the 12V battery state of charge may be estimated to be lower than the actual state of charge. As a result, under certain driving conditions the idle stop operation may be incorrectly inhibited.	9/19/2017	7/16/2018	147612	257
5045	Some 2015-2017 Dodge Charger SRT and Dodge Challenger SRT vehicles equipped with a 6.2L Hellcat engine (sales code E5D) are having catalytic converters replaced. Customers are bringing in their vehicles after Malfunction Indicator Lamp (MIL) illumination (P-codes P020 and P030 for catalyst efficiency are set).			13948	13948
5046	On some 2016-2018 Infiniti Q50 and Q60 vehicles, customers are experiencing a MIL illumination related to the Mass Air Flow sensor (DTC P0101, P010B), and in some cases, a MIL may also illuminate for the Manifold Absolute Pressure sensor (DTC P0106). Infiniti has investigated and found that, under certain conditions, air flow learning may occur during additional throttle valve openi			39168	71
5047	Some 2014MY Chrysler 200 and Dodge Avenger ("25") vehicles equipped with a 2.4L PZEV World Gas Engine (sales code: EDG) might experience cracked exhaust manifolds due to thermal metallurgical fatigue. This situation has the potential to cause both an unusual noise (ticking) from the engine compartment, as well as a localized leak located at the exhaust manifold.			25669	90
5048	Some 2014MY Chrysler 200 and Dodge Avenger ("25") vehicles equipped with a 2.4L PZEV World Gas Engine (sales code: EDG) might experience cracked exhaust manifolds due to thermal metallurgical fatigue. This situation has the potential to cause both an unusual noise (ticking) from the engine compartment, as well as a localized leak located at the exhaust manifold.			25669	90
5049	Component: Fuel low pressure sensor (LPS). The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail. The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load. The concerned sensor went of production 2016 week 16.			15305	15305

	<p>The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956.</p> <p>Analysis have shown, that the component has been replaced in about 41% due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats).</p> <p>In the other 59% of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.</p>	7/31/2014	7/30/2015	6359	1246
	<p>The affected part number 13517588879 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services.</p> <p>Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump.</p> <p>Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can effect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL illumination).</p> <p>In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL illumination.</p> <p>In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.</p>	8/31/2009	7/30/2010	737	216
	5064 Certain 2018MY Toyota/Lexus vehicles may exhibit a condition in which the rear O2 sensor monitor may not detect a slow response malfunction within the engine exhaust system at the time of fuel cut operation. 	<p>Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter.</p> <p>1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning.</p> <p>2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.</p>			4243	7
	5070 On some 2019 Nissan Altima vehicles, due to an assembly process error that has since been corrected, the retainer clip on the connection between the low-pressure fuel tube and the high-pressure fuel pump may not have been locked into position properly. If the retainer clip is not locked into position properly, the fuel tube may	5/25/2018	10/30/2018	23865	100
	5071 Daimler AG has determined that, in case a fault is detected by the monitors of the oxygen sensor heaters, specific values which can be read out by the Generic Scantool may be updated more often than specified by OBD regulations. The functionality of the monitors themselves, as well as fault freeze frame data, is not affected. In case of a detected fault, the malfunction indicator lamp w			5522	0
	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	6/30/2015	6/29/2016	904	904

Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2019	5/7/2019	63784	63784
5007					
	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). 5009					
	<p>The affected part number 11617801943 relates to the VENTURI TO THROTTLE O-RING (PROFILE GASKET). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBM0V03 J0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mi) (Please see corresponding EDIR-UG-N57/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mi). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component VENTURI TO THROTTLE O-RING (PROFILE GASKET) is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298

	5152 2020 model year Hyundai Velosters equipped with 2.0L engine have experienced a malfunction indicator light (MIL) illumination with a diagnostic trouble code P030X. According to the investigation, the main cause is an improper data calibration for cylinder imbalance fuel adaptation in case of a certain deteriorated cylinder engine roughness. To improve this matter, Hyundai will reproc			577	577
	Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740iLd xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017).	6/30/2017	12/30/2018	1049	1049

	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with 7 (if applicable) 7 Check-Control-Indication (depending on grade of damage) Smell of exhaust gas. Unusual noise from the engine compartment Smoke development from the engine in all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 55d and 535d xDrive)</p> <p>5155 produced between 07/01/2013 and 05/31/2017.</p> <p>5156 On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020??? leak. This is due to a possible hardware problem with the Diagnostic Module for Tank Leakage (DMTL).</p> <p>5157 On certain vehicles, the evaporative emissions leak detection monitor, under some conditions, may be unable to detect a 0.020??? leak. 	<p>The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956.</p> <p>Analysis have shown, that the component has been replaced in about 31% up to 42% (depending on Test Group) due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats).</p> <p>In the other 58% up to 69% (depending on Test group) of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.</p>	2/28/2014	6/29/2015	11459	963

5178	Daimler AG has determined that the engine control unit software of the affected vehicles with 4- and 6-cylinder gasoline engine from the production range 12/2012 until 06/2017 may not meet internal specifications which could lead to an erroneous activation of the MIL. In certain circumstances when the vehicle is parked for longer than 6-8 hours, the temperature difference between t			6945	0
5179	Daimler AG has determined that the engine control unit software of the affected vehicles with 4- and 6-cylinder gasoline engine from the production range 12/2012 until 06/2017 may not meet internal specifications which could lead to an erroneous activation of the MIL. In certain circumstances when the vehicle is parked for longer than 6-8 hours, the temperature difference between t			8916	123
5180	The part number 13627793825 relates to the component rear oxygen sensor (downstream catalyst). In about 52% of all cases the component rear oxygen sensor has been replaced due to implausible measurement data of oxygen concentration. Those implausibilities lead to a fault code storage and MIL illumination. The remain	6/30/2013	6/29/2014	5161	671
5181	Electric Rear Axle Drive (ERAD): The ERAD consists of an electric motor combined with a fixed gear transmission and clutch. The electric motor is a water-cooled 3-phase AC synchronous motor for pure electric or hybrid operation which drives the rear wheels. In addition the ERAD provides regenerative braking capability which is used to charge the high-voltage battery. A clutch is used to disconnect the electric motor from the transmission, consisting of a worm gear connected to a dog clutch.				
5182	The defect is confined to the dog clutch hardware which may not allow proper engagement of the electric motor to the transmission.	4/18/2016	4/24/2017	2526	30
5183	One manufacturing lot of capacitors used in the shift solenoid control circuits of the Transmission Control Module (TCM) was not properly processed during manufacturing. Certain capacitors may be susceptible to a degradation early in the vehicle life that can cause variation in shift solenoid pressure.			132478	24
5184	One manufacturing lot of capacitors used in the shift solenoid control circuits of the Transmission Control Module (TCM) was not properly processed during manufacturing. Certain capacitors may be susceptible to a degradation early in the vehicle life that can cause variation in shift solenoid pressure.			132478	24
5185	Daimler AG has determined that the engine control unit software of the affected vehicles with 4- and 6-cylinder gasoline engine from the production range 12/2012 until 06/2017 may not meet internal specifications which could lead to an erroneous activation of the MIL. In certain circumstances when the vehicle is parked for longer than 6-8 hours, the temperature difference between t			1801	0
5186	Daimler AG has determined that the engine control unit software of the affected vehicles with 4- and 6-cylinder gasoline engine from the production range 12/2012 until 06/2017 may not meet internal specifications which could lead to an erroneous activation of the MIL. In certain circumstances when the vehicle is parked for longer than 6-8 hours, the temperature difference between t			29	9
5187	Daimler AG has determined that the engine control unit software of the affected vehicles with 4- and 6-cylinder gasoline engine from the production range 12/2012 until 06/2017 may not meet internal specifications which could lead to an erroneous activation of the MIL. In certain circumstances when the vehicle is parked for longer than 6-8 hours, the temperature difference between t			7470	1
5188	Daimler AG has determined that the engine control unit software of the affected vehicles with 4- and 6-cylinder gasoline engine from the production range 12/2012 until 06/2017 may not meet internal specifications which could lead to an erroneous activation of the MIL. In certain circumstances when the vehicle is parked for longer than 6-8 hours, the temperature difference between t			50973	362
5188	Daimler AG has determined that the soot particulate sensor could fail due to the following root causes: Root Cause A: Particles on the sensor element resulting from the manufacturing process. Root Cause B: Flaking of the electrode due to insufficient evaporation of humidity inside the sensor element. Both root causes lead to an electrical failure of the soot particulate sensor. In case of failure the Malfunction Indicator Lamp (MIL) is illuminated.			4423	254
5189	Component: Vehicle Emission Certification Information Labels (VEC) Atlas - Emission Control Labels included a "Zero EVAP" statement which is not relevant for 2018, LEVII. Solutions: (1) Correct the target lambda value for specific blocks within the fuel calibration map. (2) Enable quick start of the second lambda sensor, so the ECM can use its measured value as a secondary input sooner to modify the fuel mixture should it need to. -Suction Tube Model: Event: Under certain conditions, after the start up overshoot, a small rpm diver may occur which can be noticed by customers. Solution: Previous analysis showed that there is a difference in take-off behavior between a break-through start and a normal start. Differences in the timing of the reset function during ignition-ON resulted in incorrect values of the initialization variables, which are issues in the initial function for crankcase-ventilation function			32747	32747

Between 10/2013 and 04/14 a modified component with same part number but different index (index 04) has substituted component with index 03 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent hose connecting line. Between 05/14 and 06/15 an additional hardware improvement on the pipe connector has been introduced in production and as replacement part (part number 11158635843). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647299 is used since 07/15 in production and as a replacement part for previous model years.</p> <p>Analysis have shown that in about 90% the original assembled part with part number 11157601453 has been replaced because of leakage problems caused by fragile parts of the vent hose connecting line. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158635843, these problems could be reduced to 60% valid replacements.</p> <p>A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647299.</p> <p>The component vent hose connecting line with part number 11158647299 therefore is robust, has/had no malfunction and is/was working properly.</p> <p>Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent hose connecting line with part numbers 11157601453 and 11158635843.</p>	2/28/2013	4/29/2014	15633	1200
5217	<p>Due to BMW internal testing (data analysis), BMW has detected an issue with component crankshaft sensor as built in different models with 3-cylinder engines B36/B38, 4-cylinder engines B46/B48 and 6-cylinder engine B58 produced between 05/16/2018 and 06/13/2018.</p> <p>Defect description: Software bug in the chip of the crankshaft sensor could freeze the adaptation value between the crankshaft reluctor wheel and the sensor. 	<p>The part number 13518573162 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY15 Diesel models with 6 cylinder engine N57 (Test Groups FBMKV03.0N57 and FBMKTD3.0N57). Beginning with 12/2016 a more robust hardware with part number 13518597821 was introduced in production and as replacement part in service.</p> <p>The part number 13518571796 relates to the gasoline lubricated component high pressure pump (Diesel) as built in production for MY15 Diesel models with 4 cylinder engine N47 (Test Groups FBMKV02.0N47 and FBMKTD2.0N47). Beginning with 12/2016 a more robust hardware with part number 13518597819 was introduced in production and as replacement part in service.</p> <p>Analysis (applying to the original built part numbers 13518573162 and 13518571796 for component high pressure fuel pump Diesel) have shown that regional varying gasoline quality have a great impact on the mechanical deterioration of the component high pressure pump. In worst cases a lower quality could lead to a break down respectively to mechanical cuttings of the high pressure pump track roller. Those metal warfs could float through the entire fuel system (e.g. high pressure/low pressure system and tank) and accumulate anywhere. Such a contaminated system could not provide the necessary rail pressure at engine start (causing a non-start) respectively could lead to a limp home mode including a performance reduction. OBD system will identify those malfunctions and trigger a fault code storage with MIL illumination. The replacement of the high pressure fuel pump has been in all cases the right measure to repair the malfunction.</p>	2/28/2014	6/29/2015	1505	160

	<p>A customer may report the malfunction indicator lamp (MIL) is illuminated, lack of power and sometimes noise coming from the engine bay. The stored diagnostic trouble code (DTC) points to "turbocharger under-boost" which results from a failure of the Turbo-Exhaust Manifold. Jaguar Land Rover introduced a brazed scroll manifold which at high time in service is starting to disintegrate. The root cause being a combination of thermal fatigue and vibrations which will make the joints loose.</p>			1101	473

	<p>The part numbers 11157640285, 11158637873 and 11158647961 relate to the vent pipe PCV. Part number 11157640285 with index 01 has been used in production between 07/12 and 01/14. Between 02/2014 and 04/14 a modified component with same part number but different index (index 03) has substituted component with index 01 as production and as replacement part. This new part exhibits a notched ring, which should stabilize some due to temperature impact fragile areas of the vent pipe. Between 05/14 and 06/15 an additional hardware improvement in the welding geometry of the vent pipe has been introduced in production and as replacement part (part number 11158637873). Beginning with 07/15 an adjustment of used material has made the notched ring unnecessary. This new component with part number 11158647961 is used since 07/15 in production and as current replacement part for vehicles produced before. Analysis have shown that in about 90% the original assembled part with part number 11157640285 has been replaced because of leakage problems caused by fragile parts of the vent pipe. These problems result in a reduction of boost pressure leading to a performance loss, which will be recognized by the OBD system enabling MIL. Since the usage of part number 11158637873 in 05/14, these problems could be reduced to 60% valid replacements. A complete elimination of the hardware issue could be fulfilled with introduction of the new material used with part number 11158647961 beginning with 07/15. The component vent pipe PCV with part number 11158647961 therefore is robust, has/ had no malfunction and is/was working properly. Considering the afore mentioned explanations the Weibull results and valid fail values listed in this report relate to the less-robust component vent pipe PCV with part numbers 11157640285 and 11158637873.</p>	6/30/2012	5/31/2013	39763	2400

	<p>DAG has determined that the diesel particulate filter may crack due to an insufficiently robust welded connection. Specific environmental influences in the form of corrosion could also have a negative effect on the long term durability of the diesel particulate filter. This can lead to tensions within the exhaust system and thus also may cause the diesel particulate filter to crack.</p> <p>In addition, in individual cases, it may be that during repairs to the exhaust system that are unrelated to a defect of the diesel particulate filter, the exhaust system was not replaced in accordance with the DAG specifications. Specifically, the issue might arise where it is necessary for the workshop to replace the exhaust system (including the diesel particulate filter) and the replacement system is not fitted according to DAG specifications. This can lead to tensions within the exhaust system and thus may also cause the diesel particulate filter to crack.</p> <p>In both cases, a fault is stored in the engine control unit software and the engine diagnostics warning lamp (MIL) is activated.</p>			4683	179

5258	<p>Post catalyst oxygen sensors (part numbers 9A790626550 and 9A790626551) are being replaced in the field for MIL illumination. Fault codes most frequently stored are P227000 and/or P227200-“Oxygen Sensor bank 1 and/or 2 Signal Stuck Lean”</p> <p>Analysis shows that the reference air canal of the sensor was contaminated with Silicone (SiO2) that originated from the cable protection sheath. The sheath was changed to an alternative material.</p> <p>Analysis also showed that the temperature of the sensor was too low during diagnosis, so the heating model of the engine ECU software for the 3.0L version was changed.</p> <p>A customer may report the malfunction indicator lamp (MIL) is illuminated. The stored diagnostic trouble code (DTC) points to “Low pressure fuel system ?pressure too high” which results from a failure of the low pressure fuel sensor. Root cause points to a failure of the internal sensor circuit board as a result of small amounts of fuel ingress through the internal “O” ring seal under condit</p>	10/10/2016	6/13/2017	3107	261
5259				28230	7578
5260					
	<p>Some 2017 and 2018 Chrysler Pacifica (7RU??) PHEV vehicles can set P0420 and P0430 Catalyst Monitor DTCs due to catalyst damage caused by the engine running with incorrect synchronization. While operating the engine in hybrid mode, unburned fuel can exit the cylinders, flow downstream and combust within the catalyst.</p>				
5261	<p>During some auto restart events, the engine can synchronize 360 degrees out-of-phase. The detection of this mis-synchronization was inadvertently compromised with the software that was introduced in Voluntary Safety Recall U73.</p>			7414	7414
	<p>? Tank Vent Purge Valves (part#s 94811002063, 94811002012, & 94811002013) are being replaced in the field for illuminating the MIL, prompting immediate customer action.</p> <p>? Desired pressure drop in the evaporative emissions system is not reached in the specified time limit when the purge valve is commanded closed setting DTC P0456.</p> <p>? Analyses revealed a damaged membrane of the purge valve due to fuel contamination. This leads to an incomplete closing of the valve.</p> <p>? An improved Tank Vent Purge Valve from a different manufacturer can be used</p>			4166	237
5262		6/30/2018	2/27/2019	81	81
5263					
	<p>Due to BMW internal testing (data analysis), BMW has detected an issue with component crankshaft sensor as built in different models with 3-cylinder engines B36/B38, 4-cylinder engines B46/B48 and 6-cylinder engine B58 produced between 05/16/2018 and 06/13/2019.</p> <p>Defect description:</p> <p>A software bug in the chip of the crankshaft sensor could freeze the adaptation value between the crankshaft reluctor wheel and the sensor. The signal values of the reluctor wheel would be lost, which will lead to an OBD related failure storage, reduced power and MIL illumination.</p>	5/15/2018	6/6/2018	2424	2424

5307	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	6/30/2013	6/29/2014	10900	10900

5309	<p>Based on manufacturer technical/data analysis, BMW detected a software failure implemented on all BMW PHEV vehicles (330e, 530e sDrive, 530e xDrive and 740e xDrive) produced between 07/01/2016 by 08/31/2018. Failure description:</p> <p>In case a limp home mode (full throttle operation instead of variable valve lifting/timing) is active due to a fault in the VVT (valvetronic) system, a parallel existing software failure became also active with influence on the Cold Start Emission Reduction Strategy (CSERS) and thus causing an HC emission deterioration. In more detail, during the catalytic converter warmup phase after a cold start, the warming up rate of the catalytic converter while engine warmup is reduced so that the operating temperature of the catalytic converter is reached with a delay (1-2 minutes instead of 30-40 seconds).</p>	2/28/2017	10/29/2018	2873	2873

In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	6/30/2013	6/29/2014	5167	5167

5317	Daimler AG has determined that certain GT-AMG-Class (platform 190), E-Class (platform 213), S-Class (platform 217 and 222) and GLC-Class (platform 253) vehicles experience a software error. In the event of a stuck open back pressure valve of the tank ventilation, the engine would enter the limp home mode as intended due to the first fault code entry (approx. 30% of the engine power).			4508	10
5318	Daimler AG has determined that on certain S-Class (platforms 217 and 222) and E-Class (platform 213) vehicles the software might detect a misfire even when no misfire occurred. In this case the Malfunction Indicator Lamp (MIL) would erroneously illuminate, and report a misfire even though no misfire had occurred.			919	355
5319	Daimler AG has determined that certain E-Class (platform 213 and 238) and S-Class (platform 217 and 222) vehicles experience a software error. In case of a switch off of the onboard electrical system supply by the discharge protection system, OBD diagnosis information (e.g. fault codes) of the current driving cycle might not be stored. The customer will not receive an advance warning du			1	0
5320	Daimler AG has determined that certain S-Class (platform 217 and 222) vehicles experience a software error. In case of the described defect, a stored cold start diagnosis fault code could be healed erroneously.			2	2
5321	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.			4494	3

	<p>Wrong screwing/Connection of the high pressure pump (HDP) on selected model year 2018 and 2019 vehicles with 8-cylinder engines N63 produced between 10/10/2018 and 05/08/2019 (based on evaluation of the screwing curve) could lead to the following scenario:</p> <p>During engine operation this wrong screwing/connection of the HDP could get untightened, the HDP experiences an overload so that the adapter of the HDP could break. As a result the connected fuel line could get untightened so that fuel could leak from the fuel line. The drop down of the fuel rail pressure will be detected by OBD including fault code storage and MIL illumination. In case of further drop down a limp home mode will be activated including information for the driver.</p>	10/11/2018	4/4/2019	5	5
	<p>Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.</p>	4/11/2017	3/22/2018	20451	30
	<p>Sodium in the fuel may contaminate the surface of the fuel pump motor brushes that may cause fuel flow to decrease. As a result, the MIL may illuminate for P0087 "Fuel System Pressure (Low)" or in some cases vehicle may stall.</p>	9/9/2017	7/16/2018	40272	4

This situation leads to a permanent deterioration of the sensor signal quality. 2) Crack due to therm</p>			6132	224
	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 9th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2018	2/27/2019	5792	5792

	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B58, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p> <p>5403 Some 2019 MY 2.0L GTDI and 2.7L Nautilus, 2019 2.3L GTDI and 5.0L Mustang and 3.5L GTDI Navigator vehicles were built with an instrument cluster that may not display required telltales including the malfunction indicator light.</p> <p>5404 Some 2019 MY 2.0L GTDI and 2.7L Nautilus, 2019 2.3L GTDI and 5.0L Mustang and 3.5L GTDI Navigator vehicles were built with an instrument cluster that may not display required telltales including the malfunction indicator light.</p> <p>5405 The affected part number 13538508084 relates to the FUEL FEED LINE (TO HIGH PRESSURE PUMP). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2018 Test Group JBMKT03.0NS7, it</p>	11/30/2018	5/7/2019	2079	2079

	<p>Some 2018 model year Hyundai IONIQ Hybrid 1.6L vehicles have experienced malfunction indicator light (MIL) illumination accompanied by diagnostic trouble code P0455. According to the warranty parts investigation, a salt crystal that was located inside of poppet seal of NVLD was observed. Hyundai found out the salt crystal made poppet valve of NVLD stuck and did not detect very small leak in evaporative system. It is assumed that the salt crystal has been originated from the contents of sea breeze and fog coming from the California coast area.</p> <p>5412 To improve this matter, Hyundai will develop a countermeasure part and publish a Technical Service Bulletin to provide repair information to Hyundai dealers and will replace the affected NVLDs and filters by service action.</p>			144883	162
	<p>Some 2014-2019MY Ram 1500 ("DS") Trucks equipped with a 5.7L engine may experience exhaust manifold fastener failures due to metallurgical fatigue. This situation has the potential to cause both an unusual noise (ticking) from the engine compartment, as well as a localized gasket leak located at the exhaust manifold-cylinder head interface.</p> <p>5413</p>			270593	655
	<p>Originally FCA US reported that on some 2015-2016 MY 3.6L Dodge Charger and Chrysler 300 fleet vehicles are experiencing replacements of the left side fuel pump module. An extended warranty is being provided which will cover 2011-2016 MY Dodge Charger (Pursuit) vehicles equipped with sales code AHB - Police Group.</p> <p>AFCA US review of 58 warranty claims found that of the 58 fuel pump/level units replaced for the following reasons: 4 (6.9%) due to a no start condition, 48 (82.8%) due to a fuel smell or leak at the flange and 2 (3.5%) due to a fuel level sensor issue. The remaining 4 (6.9%) units were right side fuel pump/level unit modules.</p> <p>The two primary types of failure are caused by a melted electrical connector which is part of the top flange and a failed capacitor inside the left fuel pump module. First, an internal capacitor within the left fuel pump module may have been damaged during the fuel pump assembly process which results in a vehicle no start.</p> <p>5414 Second, the majority of these vehicles are police vehicles. A combination of the extended run time of these vehicles causes temperature to increase along with temperature generated by the flow of current to the fuel pump. This is causing the electrical connector/flange to melt and allow fuel vapor to escape.</p>			1575	1575

5420	Analysis: On certain vehicles, a small amount of fuel may leak from one or both fuel rails. In the presence of an ignition source, leaking fuel may result in a fire.			22379	22379
5421	The Evaporative Emissions Leak Monitor diagnostic completion ratio can be overstated due to a miscalculation of the denominator value. The completion ratio identifies when the indicated diagnostic should have completed versus when it did. The evaluation did not increment the denominator beyond a value of 1.			5624	5624
	<p>Analyses have shown, that in about 43% of all cases the component fuel injector was replaced due to a valid malfunction of the component fuel injector itself. Based on poor diesel fuel quality an extended plate-out/coat inside the injector is possible. This coat results in an increased pilot injections correction. If the adaption limit monitoring/corrected energizing time exceeds a time threshold (e.g. 250 Tsec), a corresponding OBD fault code (e.g. DTC P022CD for injector 1) including MIL illumination is set (Injection quantity monitoring /Zero Fuel Calibration [ZFC]). In about 50% of all cases the component injector was replaced besides the malfunctioning component high pressure fuel pump (according service instruction) due to contamination of the high/low pressure system with cuttings (please see also e.g. EDIR-QH-N57-0267 or EDIR-QH-N57-0324). In the other about 75% the component fuel injector was replaced without any valid reason (e.g. no corresponding fault code indicating a malfunctioning fuel injector).</p>	6/30/2016	6/29/2017	1502	269
5422	Certain vehicles may have a condition which affects the electrical connections to the vehicle's accelerator pedal position sensors. Electrical connection to these sensors may be lost at times, intermittently. This is caused by dimensional variation in the pedal sensor housing that can allow the sensor's electrical terminal buck to move relative to the sensor's circuit board.			21598	2249
5423	Certain vehicles may have a condition which affects the electrical connections to the vehicle's accelerator pedal position sensors. Electrical connection to these sensors may be lost at times, intermittently. This is caused by dimensional variation in the pedal sensor housing that can allow the sensor's electrical terminal buck to move relative to the sensor's circuit board.			22208	175
5424	Certain vehicles may have a condition which affects the electrical connections to the vehicle's accelerator pedal position sensors. Electrical connection to these sensors may be lost at times, intermittently. This is caused by dimensional variation in the pedal sensor housing that can allow the sensor's electrical terminal buck to move relative to the sensor's circuit board.			4517	366
5425	Some 2016-2017 Jeep Compass/Patriot (MK) vehicles with a 2.4L engine (ED3) and automatic transmission (D44) may have a Transmission Range Sensor (TRS) that will set a MIL and DTC Codes P0705 (TRS A Circuit (PRNDL Input) and/or P0706 (TRS Performance), due to a terminal flatness issue on the sensor.			17789	55
5426	Some 2016-2017 Jeep Compass/Patriot (MK) vehicles with a 2.4L engine (ED3) and automatic transmission (D44) may have a Transmission Range Sensor (TRS) that will set a MIL and DTC Codes P0705 (TRS A Circuit (PRNDL Input) and/or P0706 (TRS Performance), due to a terminal flatness issue on the sensor.			53513	340
5427	Due to inappropriate software of the OBD system, the MIL bulb check and readiness blinking are not appropriately output under a certain condition and/or multiple Permanent diagnostic trouble codes are not correctly output under certain conditions.	10/8/2018		5011	0
5428	Due to inappropriate software of the OBD system, the MIL bulb check and readiness blinking are not appropriately output under a certain condition and/or multiple Permanent diagnostic trouble codes are not correctly output under certain conditions.	8/4/2017	9/27/2018	4766	0
5429	On certain six-cylinder plug-in hybrid vehicles (S 550 Hybrid, S 550 e and GLE 550 e 4MATIC) the temperature sensor in the electric machine may send implausible values due to temporary short circuit at the contact. In case of the described defect, the Check Engine Light (MIL) would be illuminated, prompting the driver to visit a servicing dealer, and the maximum power of the hybrid system would be limited.			187	6
5430	On certain six-cylinder plug-in hybrid vehicles (S 550 Hybrid, S 550 e and GLE 550 e 4MATIC) the temperature sensor in the electric machine may send implausible values due to temporary short circuit at the contact. In case of the described defect, the Check Engine Light (MIL) would be illuminated, prompting the driver to visit a servicing dealer, and the maximum power of the hybrid system would be limited.			2	0
5431	In certain vehicles and under certain conditions, the engine's fuel injectors may deliver an improper amount of fuel. The typical identified fuel injector failures are due to wear on the armature caused by a combination of a vibration in the armature and the propensity of the armature to spin on the pintle perch.			97030	1458
5432	In certain vehicles and under certain conditions, the engine's fuel injectors may deliver an improper amount of fuel. The typical identified fuel injector failures are due to wear on the armature caused by a combination of a vibration in the armature and the propensity of the armature to spin on the pintle perch.			758	38
5433	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due to moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. When this happens, the MIL will illuminate for either P0441 (purge monitor) or P1457 (FTPS electri			30477	79
5434	Some 2014-2017MY vehicles are experiencing fuel vapor pressure sensor replacements. The fuel tank pressure sensor may fail due to moisture intrusion through the electrical connector and vent filter that causes corrosion to the internal sensor circuits, adversely affecting the sensor output. 	<p>The affected part number 13538506546 relates to the FUEL RAIL-INJECTOR FUEL LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMW03 0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mls). Please see corresponding EDIR-OG-N57/N47-0311. In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mls). Without the high pressure fuel pump malfunction (leading to the cuttings</p> <p>contamination) the component FUEL RAIL-INJECTOR FUEL LINE is/was working properly and has/had no malfunction.</p> <p>The affected part number 13538506547 relates to the HIGH PRESSURE PIPE (ACCUMULATOR TO INJECTOR). Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMWX</p> <p>Daimler AG has determined that on certain GT-, C- and G-Class vehicles (190, 205 and 463 platforms) the engine control unit software could have a mistake in the calibration data set relating to catalyst heating. In case of the engine being shut down for more than 67 hours, the catalyst heating created by an increase of the idling speed might not be initiated with the next engine start as</p>	6/30/2015	10/30/2016	1209	298

5528					6970	6970
	<p>The affected part number 16127205304 relates to the REAR FUEL FEED LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDI-OG-NS7/N47-0311). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component REAR FUEL FEED LINE is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298	
	<p>A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, may lead to premature component malfunction. Additionally, a deficiency in the Engine Control Module (ECM) calibration may lead to the heated sensing element experiencing thermal shock following water contact leading to sensor malfunction.</p> <p>Both conditions cause the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTCs), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM), also known as the Powertrain Control Module (PCM).</p>			1936	331

5538	<p>A manufacturing fault at the supplier results in misalignment within the post-catalyst heated oxygen sensor leading to a side load on a ceramic internal part. This pre-stress, in combination with normal vehicle use, leads to premature component malfunction. The condition causes the Malfunction Indicator Lamp (MIL) to be illuminated and diagnostic trouble codes (DTCs), relevant to the post-catalyst heated oxygen sensors, to be stored in the Engine Control Module (ECM).</p>			2426	221
5539	<p>The affected part number 13517588879 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services. Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump. Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can affect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL illumination). In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL illumination. In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.</p>	6/30/2011	6/29/2012	1048	435
5540	<p>The affected part numbers 51747497279 and 51137497285 relate to component Upper and Lower AIR FLAPS (Active Grill Shutters). Although all listed models in model year 2018 test group JBM0J03.0B5X are equipped with lower and upper air flaps (active grill shutters), the affected part numbers 51747497279 and 51137497285 solely apply to 5-Series models 540i and 540i xDrive (upper and lower air flaps). The models X3 M40i and 640i xDrive Gran Turismo are equipped with lower and upper air flaps indicated each by different part numbers (but representing the same hardware status). Analyses have shown that component lower air flaps with part number 51137497285 was replaced in about 95% of all cases due to a malfunction detected by the OBD system including fault code storage and MIL illumination (e.g. electrical failure of actuator, stuck shutter, shutter performance). There are two different failures which could cause these valid malfunctions:</p> <p>Failure#1 (about 85% of all valid failures): Contamination (mix of transmission oil, brush dust and copper abrasion) of the commutator (daubed commutator slit) leads to an increased current of the actuator so that this component fails.</p> <p>Failure#2 (about 15% of all valid failures): The kinematics /component ?spacer? (connecting element of the coupling bar between actuator and the shutters) could be unhinged or lost, so that the shutters could not be controlled/moved any more.</p>	6/30/2017	7/30/2018	22268	4855
5541	<p>The affected part numbers 51747497279 and 51137497285 relate to component Upper and Lower AIR FLAPS (Active Grill Shutters). 5544	<p>Calibration Concerns: Scan Tool Mode \$0A, this is a Non-erasable permanent DTCs (Mode \$0A) for fuel rail pressure monitoring. The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC) Calibration Concerns: NOx Sensor Rationality monitor, this is a NOx Sensor out-of-range monitor without function (P2202, P2203, P22A0 and P22A1). The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018 (Gen 2.1 SUV and July 2, 2018 (Gen 2 PC) Calibration Concerns: Throttle Valve Rationality monitor: The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018 Calibration Concerns: Oxidation Catalyst (DOC) efficiency monitor: The issue occurs during high altitude driving conditions, requires replacement of the DOC (impacting durability), and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM Calibration Concerns: Boost system Rationality monitor, Boost system gross leakage monitor with limited function. The issue was discovered during PVE [i][2] testing and was reported to the agencies on May 7, 2018 Calibration Concerns: Engine Control Module (ECM) Inhibit relations, Planned improvements of inhibit relations to avoid additional fault codes and ensure reliable guidance for service. The issue was discovered during PVE [i][2] testing and was reported to the agencies on July 2, 2018. Calibration Concerns: Engine Control Module (ECM) Injection Limitation, Reduction of the fuel injection pattern at high ECM temperatures and low battery voltage. This issue has not caused customer complaints and is unlikely to occur in ordinary driving conditions. Fixing this issue does not require changing the AEM. Calibration Concerns: Service Tester/Tools, Service base setting to adjust idle speed. This is a minor change designed for dealer diagnostics. It does not change the AEM calibration Calibration Concerns: Vehicle Drivability (Poor Fuel Adaptation), Customer complaints regarding drivability during engine warm-up. The issue affects drivability of the vehicle, occurs during ordinary vehicle operation and use, and is caused by a modified calibration in the field fix. To fix this issue will require a modification to the AEM. Calibration Concerns: Reductant Supply Module, The SCR module is being replaced due to a false MIL condition resulting from high temperatures/diagnostic thresholds of consumption deviation monitor. The change will impact the AEM calibration, but the change is not required to fix this Technical Issue. The proposed change is an improvement for the issue, but not a complete solution. 5578	<p>Component: Fuel low pressure sensor (LPS). The LPS provides a value for closed loop control of the fuel pressure before the high pressure fuel rail.</p> <p>The circuit board inside the LPS is protected by a gel coating. The analysis of returned warranty parts indicate the gel has been found to be in various states of degradation. If the gel is degraded damage to the circuit board may occur, resulting in an activation of the Malfunction Indicator Lamp (MIL). If the sensor fails table values are used as replacement for the fuel pump target load.</p> <p>The concerned sensor went of production 2016 week 16.</p>			15305	15305

	<p>DAG has identified two main root causes, which may lead to replacement of the exhaust gas recirculation valve:</p> <p>1.A sluggish exhaust gas recirculation valve, due to foreign particles or carbon build up, could lead to a deviation during exhaust gas recirculation control. The deviation will result in illumination of the Malfunction Indicator Lamp (MIL), prompting the driver to visit a servicing dealer.</p> <p>2.An external leakage of the exhaust gas recirculation valve through the connection fitting could result in water with coolant entering the engine bay. Due to the leakage of the exhaust gas recirculation valve, the coolant level might drop gradually, resulting in a warning ?check coolant level?? being displayed in the instrument panel.</p>

5596	DAG has identified three main root causes which may cause failure of the up-stream and down-stream NOx sensors. 1) Oscillating signal: An increased resistance in the air-reference-electrode of the sensor may lead to increased Kerist voltage which may cause the modulator to oscillate. This situation leads to a permanent deterioration of the sensor signal quality. 2) Crack due to therm			3000	0
5597	Due to inappropriate calibration of the OBD system, the Three way catalytic converter (TWC) monitoring frequency may be insufficient and below the In Use Performance Ratio (IUPR) requirements.	3/1/2017	9/19/2017	2114	0
	<p>The affected part number 13517588879 relates to the high pressure pump from supplier Continental which is also currently used as replacement part in services.</p> <p>Analyses have shown, that in about 90% of all cases due to confirmed malfunctions of the high pressure pump.</p> <p>Main reasons for the high pressure fuel pump malfunctions are oil losses caused by a cracked coupling or shaft spin. Both malfunctions, which can effect emissions, lead to reduced pressure in the fuel system and result in a pressure fuel pump and engine limp home with noticeable engine performance reduction (including MIL illumination).</p> <p>In addition, the high pressure fuel pump is also replaced due to a sporadically sticking flow control valve which results in fault code storage and occasionally MIL illumination.</p> <p>In the about other 10% of all cases the component high pressure pump was replaced without any corresponding fault code storage and without MIL illumination.</p>

5599	Certain 2018MY Toyota/Lexus vehicles may exhibit a condition in which the rear O2 sensor monitor may not detect a slow response malfunction within the engine exhaust system at the time of fuel cut operation. The Engine Control Module/ECM logic has been modified to prevent misdetection.			73715	73715
	<p>Daimler has identified two main root causes, which may lead to replacement of the pressure gauge converter.</p> <p>1) The diagnostic thresholds of the pressure gauge converter sensor might be calibrated too sensitively/narrowly. Therefore, in certain circumstances, an error of the pressure gauge converter sensor could be set and the MIL could be activated erroneously. In this case, the sensor is actually not malfunctioning.</p> <p>2) An incorrect position of the gold plates within the pressure gauge converter sensor can lead to internal short circuits to ground. Therefore, an error of the pressure gauge converter sensor could be set and the MIL could be activated.</p>

5625	<p>If the OBD monitor for the oxygen sensor heater is detecting a malfunction, the corresponding OBD fault code (pending fault code) is set. Furthermore all other oxygen sensor monitors and the catalyst monitor will be disabled after this pending fault code is set to avoid false diagnostics. Due to a software bug the OBD monitor for the oxygen sensor heater is disabling itself after the pending fault code is set, so that in the following driving cycles the malfunction cannot never be confirmed (no confirmed fault code is set) and MIL will never be illuminated to inform the customer as required by the OBD regulations (a fault healing to reset the stored pending fault code would be also not possible). In case the pending fault code is set as described above, the setting of the oxygen sensor is put back to the original status. Means in case trim adaptations were active at a certain level to ensure emissions are below the standards, there is a reset of these adaptations which could lead to an emission increase (e.g. above the emission standards). The OBD software bug as described above does apply to certain model year 2019 and 2020 models with 4 cylinder engine B46, 6 cylinder engine B55, 8 cylinder engine and 12 cylinder engine N74 produced between 11/2018 and 8th May 2019 and to certain model year 2016, 2017, 2018 and 2019 models produced before 11/2018 but with software flash in service between 11/2018 and about mid of May 2019.</p>	2/28/2019	5/7/2019	63784	63784
5626	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the Intake Manifold and in extremely rare cases result in a possible fire.</p> <p>If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs.</p> <p>These can include:</p> <ul style="list-style-type: none">?Coolant loss with Check-Control-Indication?Loss of power with ? if applicable ? Check-Control-Indication (depending on grade of damage)?Smell of exhaust gas?Unusual noise from the engine compartment?Smoke development from the engine <p>In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017</p>	2/28/2014	6/29/2015	1505	1505

	<p>The affected part number 13537823399 relates to the INJECTOR OIL OVERFLOW RETURN LINE. Analyses have shown that this component in general was replaced in service only in conjunction with component high pressure fuel pump. For component high pressure fuel pump built in Model Year 2016 Test Group GBMXV03.0N57, BMW decided a warranty extension to full useful life (10 years / 120.000mils) (Please see corresponding EDIR-OG-N57/N47-0311) will be submitted after the reporting threshold >4% and >50 cases is exceeded). In case the high pressure fuel pump is malfunctioning and has to be replaced, the BMW services are advised, according to repair instruction, to check all parts in the high pressure fuel system, low pressure fuel system and the fuel tank system. In case any of these parts is contaminated with cuttings (caused by the malfunctioning high pressure fuel pump), these parts have also to be replaced (currently free of charge for the customer due to the BMW warranty 4 years/50.000mils). Without the high pressure fuel pump malfunction (leading to the cuttings contamination) the component INJECTOR OIL OVERFLOW RETURN LINE is/was working properly and has/had no malfunction.</p>	6/30/2015	10/30/2016	1209	298

5664	Some 2014*2017 model year Kia Rio 1.6L vehicles have experienced a customer complaint in which certain customers smell fuel inside while they are driving in the city, especially in Stop-and-Go mode at high ambient temperature. According to the investigation, Kia has found that there is a necessity of EMS purge data optimization at the high temperature condition to improve customer			18960	2
5665	Some 2010*2015 model year Hyundai Tucson 2.4L may exceed the ORVR standard. According to an investigation of canister manufacturing process/subpart/production history, Analysis indicates that the displacement of the charcoal occurs nearly immediately. Because the Defect sponge inside the canister is too short in length, so charcoal dislodging occurs with the combination of charcoal tilting and the short sponge length. As a countermeasure, a supplemental canister will be applied between the faulty canister and the Canister Close Valve (CCV) for those canisters that fail an inspection. Hyundai will add the 150cc auxiliary canister for the vehicles that fail an inspection through a voluntary service campaign (VERB) with customer notification.			3729	1
5666	Complaint: MIL on DTCs Present: P0401 (Exhaust Gas Recirculation Flow Insufficient) Components: EGR Filter Part Number ? Incorrect: 1K0253120 Part Number ? Correct: 1K0253120B Analysis: Due to a parts catalog error, an incorrect EGR Filter may have been installed on some vehicles during a past service repair visit. VW will inspect and if needed, replace the EGR filter with the correct service part. -The wrong EGR filter could affect the DPF OBD-diagnosis by not detecting a DPFFault.			2	2

	<p>Internal BMW Group investigations had revealed that in the case of some diesel vehicles, glycol-leakage from the EGR-Cooler may occur. In combination with typical soot deposits and the high temperatures normally present in the EGR module, this might result in smoldering particles. In very rare cases, this could lead to the melting of the intake Manifold and in extremely rare cases result in a possible fire. If the EGR cooler becomes leaky over time, the leaking glycol coolant could lead in combination with soot and oil sediments in the EGR module to ignitable deposits. In very rare cases, the deposits can be ignited by high exhaust gas temperature resulting in melting through spots along the inlet manifold. Hot gases could escape through the openings in the inlet manifold and cause ignition of surrounding parts/components. As a result a thermal incident can occur in extremely rare cases. The fault may only occur during operation. The customer then receives clear signs. These can include: Coolant loss with Check-Control-Indication Loss of power with 7 if applicable 7 Check-Control-Indication (depending on grade of damage) Smell of exhaust gas Unusual noise from the engine compartment Smoke development from the engine In all cases known to us, the driver had sufficient time to park the vehicle safely and to leave the vehicle together with all other occupants safely and unharmed by early recognition of the clear signs. BMW is not aware of any accidents related to this issue. Potential affected could be all Diesel vehicles with 4-cylinder engine N47 (models 328d, 328d xDrive, 328d xDrive Sport Wagon and X3 xDrive 28d) and 6-cylinder engine N57 (models X5 xDrive 35d, 740Li xDrive 535d and 535d xDrive) produced between 07/01/2013 and 05/31/2017).</p>	6/30/2015	6/29/2016	1792	1792

5675	<p>The affected part number 13538627842 relates to the FUEL INJECTOR which is used beginning with 04/2017 solely as replacement part in service when original built injector with part number 13537645956 has to be replaced. Fuel injector with part number 13538627842 includes an improvement regarding tightness due to a DLC (Diamond-Like-Carbon) coated ball inside of the injector. The following analysis applies therefore to the original built fuel injector with part number 13537645956.</p> <p>Analysis has shown, that the component has been replaced in about 31% up to 42% (depending on Test Group) due to malfunctions of the component itself. The main reason for those malfunctions could be identified in defective filter material. In case this material shows breaks pollutant particles lead to temporary or steady leakages of the injection valve. These leakages could have an impact on drivability (e.g. bucking engine run) showing misfires, which are detected by OBD system storing a fault code with MIL illumination. More reasonable malfunctions are caused by sooting of the valve injection holes or damaged valves (e.g. breaks in valve seat or broken valve seats).</p> <p>In the other 58% up to 69% (depending on Test group) of all cases, the component injection valve has been replaced although it hasn't had a malfunction itself. Other components like ignition coil, high pressure sensor or ignition plugs have been in those cases the genuine reason for fault code storage and MIL illumination.</p>	7/31/2015	7/30/2016	5013	401

Q		R	S
1	Remediation Description	Owner Notif Start DT	Number Involved in Recall
2	Volkswagen Group of America, Inc. will initiate an Emissions Service Action with Customer Notification (26J2) to install a replacement Catalytic Converter on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	12/28/2017	106
3	Volkswagen Group of America, Inc. will initiate an Emissions Service Action with Customer Notification (26J2) to install a replacement Catalytic Converter on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	12/28/2017	2741
4	Volkswagen Group of America, Inc. will initiate an Emissions Service Action with Customer Notification (26J2) to install a replacement Catalytic Converter on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	12/28/2017	2741
5	The corrective measure consists of replacing the fuel injectors with an improved version if the original fails during this extended warranty period. To prevent leakages, fuel injectors with a more robust filter material have been used in production starting with 02/15. BMW will also reimburse owners who have already replaced this part at their own expense at any time before the end of the warranty period.	2/7/2018	1844
6	FCA US will conduct a Customer Satisfaction Notification (T57) on affected vehicles to reprogram the PCM, TCM and visually inspect the EGR temperature sensor on certain vehicles within a build date range, for a crack and replace if necessary.	4/26/2018	9740
7	Volkswagen Group of America, Inc. will initiate an Emissions Service Action with Customer Notification (26K4) to install a replacement AdBlue Heater on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	5/24/2018	39778
8	Volkswagen Group of America, Inc. will pro-actively release an Emissions Recall 24CV/23W1 to address the replacements of the Snow Rap and O2 Sensor on Model Year 2009-2014 Volkswagen 2.0L TDI Engine vehicles (Generation I). All authorized dealers will be notified of this Emission Recall, and owners of affected vehicles will be mailed a notification letter that includes all needed information regarding this issue. Dealer Notification: On or about August 11th, 2017 Customer Notification: On or about August 18th, 2017	8/11/2017	51249

	<p>Volkswagen Group of America, Inc. will pro-actively release an Emissions Recall 24CV/23W1 to address the replacements of the Snow Flap and O2 Sensor on Model Year 2009-2014 Volkswagen 2.0L TDI Engine vehicles (Generation I).</p> <p>All authorized dealers will be notified of this Emission Recall, and owners of affected vehicles will be mailed a notification letter that includes all needed information regarding this issue.</p> <p>Dealer Notification: On or about August 11th, 2017 Customer Notification: On or about August 18th, 2017</p>	8/11/2017	51339
	<p>1. New sensor element (KP02).</p> <p>2. New sensor element (KP02).</p> <p>3. Optimized application and sensor installation position.</p> <p>10. 4. New sensor element (KP02).</p>	4/20/2018	4036
	<p>11. The corrective measure consists of modifying the high pressure fuel pump gasoline filter. The filter and filter housing will be designed with a more robust material to prevent deterioration. The filter material PA is replaced with PEEK and filter housing material PA is replaced with PPA.</p> <p>12. Notifications to owners of the affected vehicles will occur by late May 2018. A sample of the owner notification letter has been included for the reference.</p> <p>13. Notifications to owners of the affected vehicles will occur by late May 2018. A sample of the owner notification letter has been included for the reference.</p> <p>14. Infiniti will conduct a Voluntary Service Campaign to replace the low pressure fuel hose on any potentially affected vehicles.</p> <p>15. Infiniti will conduct a Voluntary Service Campaign to replace the low pressure fuel hose on any potentially affected vehicles.</p> <p>16. Infiniti will conduct a Voluntary Service Campaign to replace the low pressure fuel hose on any potentially affected vehicles.</p> <p>17. Infiniti will conduct a Voluntary Service Campaign to replace the low pressure fuel hose on any potentially affected vehicles.</p> <p>18. Infiniti will conduct a Voluntary Service Campaign to replace the low pressure fuel hose on any potentially affected vehicles.</p> <p>19. FCA US will perform an emissions-related voluntary safety recall (U39) on affected vehicles to inspect the fuel supply tube for damage and replace those that are torn or have partial material loss.</p>	4/20/2018 5/25/2018 5/25/2018 7/30/2018 7/30/2018 7/30/2018 7/30/2018 7/30/2018 7/30/2018 5/24/2018	17278 1700 1700 7917 844 6856 6856 7917 7917 1872
	<p>20. General Motors will conduct a safety recall on all affected vehicles to replace the high pressure fuel pump and associated high pressure fuel pipe.</p> <p>21. Owners of affected vehicles will be sent a notification and a replacement label for this campaign so they can replace the label. If customers are not comfortable replacing the labels, they may contact an authorized dealer to have the label replaced free of charge.</p> <p>22. Owners of affected vehicles will be sent a notification and a replacement label for this campaign so they can replace the label. If customers are not comfortable replacing the labels, they may contact an authorized dealer to have the label replaced free of charge.</p> <p>23. Owners of affected vehicles will be sent a notification and a replacement label for this campaign so they can replace the label. If customers are not comfortable replacing the labels, they may contact an authorized dealer to have the label replaced free of charge.</p>	6/19/2018 8/15/2018 8/15/2018 8/15/2018	375 5 65 1
	<p>The corrective measure consists of replacing the fuel injectors with an improved version if the original fails during this extended warranty period. To prevent leakages, fuel injectors with a more robust filter material have been used in production starting with 02/15. BMW will also reimburse owners who have already replaced this part at their own expense at any time before the end of the warranty period.</p>	2/7/2018	15264
	<p>To eliminate this problem, a more robust hardware (gel with a better fuel resistance) has been used in production and as replacement part since 03/2017 for all models. The pressure-temperature sensor built in the i8 is integrated in the fuel pump. Therefore, the fuel pump must be replaced in case of a malfunction on i8 models.</p>	6/15/2018	5362
	<p>To eliminate this problem, Dow-Corning sealant will be used on the thermostat pins to prevent corrosion.</p>	4/27/2018	19628
	<p>27. Any authorized Toyota dealer will inspect the CVT control software and, if necessary, perform an update for that software at NO CHARGE. After inspecting the software and, if necessary, performing the software update, the CVT solenoid valve controlling the gear ratio in the CVT will be inspected and, if necessary, the CVT valve bod</p>	8/8/2018	354958
	<p>28. Any authorized Toyota dealer will inspect the CVT control software and, if necessary, perform an update for that software at NO CHARGE. After inspecting the software and, if necessary, performing the software update, the CVT solenoid valve controlling the gear ratio in the CVT will be inspected and, if necessary, the CVT valve bod</p>	8/8/2018	17750
	<p>29. Any authorized Toyota dealer will inspect the CVT control software and, if necessary, perform an update for that software at NO CHARGE. After inspecting the software and, if necessary, performing the software update, the CVT solenoid valve controlling the gear ratio in the CVT will be inspected and, if necessary, the CVT valve bod</p>	8/8/2018	280711

82	Volkswagen Group of America, Inc. will initiate an Emissions Service Action with Customer Notification (26K2) to install a replacement AdBlue Heater on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	7/26/2018	2091
83	Volkswagen Group of America, Inc. will initiate an Emissions Service Action with Customer Notification (26K2) to install a replacement AdBlue Heater on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	7/26/2018	817
84	<p>To ensure your confidence in our product to customer in all states, Honda is extending the powertrain warranty for 6 years with unlimited mileage from the original sale date. A part of the Warranty Extension terms is the inclusion for any customer that exhibits the symptom to be eligible for Honda's Product Update PUDR-18-010-00 (HNX-RR-2018-0000795) previously launched in 21 affected cold weather states and those repairs are listed below:</p> <p>Repair #1: Replace the A/C unit ECU, reset the maintenance minder, change the engine oil, and reflash the ECU and TCU software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.</p> <p>Some vehicles had the updated A/C unit ECU installed as a part of a running change and would require only those repairs listed in repair #2 below.</p> <p>Repair #2: Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.</p>	1/28/2019	312816
85	Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.	12/17/2018	122155
86	Daimler AG will extend the emissions warranty of the affected camshaft adjuster to 120,000 miles / 10 years. The introduction of a software modification for the engine control unit ensures that this issue can no longer occur from June 2017 onwards.	3/13/2019	5359
87	Daimler AG will extend the emissions warranty of the affected camshaft adjuster to 120,000 miles / 10 years. The introduction of a software modification for the engine control unit ensures that this issue can no longer occur from June 2017 onwards.	3/13/2019	20670
88	Daimler AG will extend the emissions warranty of the affected camshaft adjuster to 120,000 miles / 10 years. The introduction of a software modification for the engine control unit ensures that this issue can no longer occur from June 2017 onwards.	3/13/2019	2527
89	MNA has decided to do a voluntary emissions recall (#373) for MYs 2011-2015 and a service campaign (#374) for MYs 2016-2018 vehicles to 7re-flash?? or upload a new software version into the engine control module, free of charge.	2/7/2019	1732
90	MNA has decided to do a voluntary emissions recall (#373) for MYs 2011-2015 and a service campaign (#374) for MYs 2016-2018 vehicles to 7re-flash?? or upload a new software version into the engine control module, free of charge.	2/7/2019	1682
91	MNA has decided to do a voluntary emissions recall (#373) for MYs 2011-2015 and a service campaign (#374) for MYs 2016-2018 vehicles to 7re-flash?? or upload a new software version into the engine control module, free of charge.	2/7/2019	2480
92	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	27670
93	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	16533
94	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	20399
95	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	15713
96	FCA US LLC (FCA) will extend the warranty period from 3 years or 36,000 miles (3 years or 50,000 miles for vehicles covered under the California Emission Warranty) to an additional 1 year/Unlimited miles from Warranty Bulletin notification (X79) for vehicles already out of the warranty period to replace the fuel pump module.	7/1/2019	10587
97	FCA US LLC (FCA) will extend the warranty period from 3 years or 36,000 miles (3 years or 50,000 miles for vehicles covered under the California Emission Warranty) to an additional 1 year/Unlimited miles from Warranty Bulletin notification (X79) for vehicles already out of the warranty period to replace the fuel pump module.	7/1/2019	8811
98	The repair is to replace the fuel tank.	9/16/2019	119
99	The transmission and torque converter will be replaced with new parts not affected by this condition, FREE OF CHARGE.	3/22/2019	3424
100	Any authorized Toyota dealer will inspect the fuel filler pipe to confirm if it is properly installed and, IF NECESSARY, replace the fuel filler pipe FREE OF CHARGE.	3/22/2019	140
101	Nissan dealer technicians will inspect the front exhaust tube to confirm the part specification currently installed on the vehicles. If necessary, the technician will then replace any non-US specification tube with the correct part.	3/18/2019	6
102	Nissan dealer technicians will inspect the front exhaust tube to confirm the part specification currently installed on the vehicles. If necessary, the technician will then replace any non-US specification tube with the correct part.	3/18/2019	6
103	Nissan dealer technicians will inspect the front exhaust tube to confirm the part specification currently installed on the vehicles. If necessary, the technician will then replace any non-US specification tube with the correct part.	3/18/2019	6
104	KIA modified EMS data so that catalyst heating is entered (to ensure the catalyst reaches the activation temperature) regardless of the number of restarts and any interrupt.	8/8/2019	6076
105	KIA will reprogram the ECU through a voluntary service campaign.	8/8/2019	7327
106	This campaign instructs any authorized Lexus dealer will replace the filter in the air injection pump with an improved design filter, and replace the air switching valves in the vehicle emissions system FREE OF CHARGE. The dealer will also inspect the air injection pump for damage and may replace the air injection pump, as needed.	8/8/2019	10943

140	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	1
141	This SSC instructs any authorized Lexus dealer will perform a software update to the engine ECU FREE OF CHARGE to owners.	1/30/2019	2430
142	Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU, when applicable, A/C control unit software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.	3/7/2019	22285
143	Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU, when applicable, A/C control unit software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.	3/7/2019	6231
144	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	1
145	<p>Suzuki will conduct a voluntary emissions recall campaign to perform the following actions:</p> <ul style="list-style-type: none"> (1) Install a cover that closes the opening between the left rear wheel housing and the fender lining, where the suction pipe inlet is located, to reduce the inflow of sand or other extraneous material in the vicinity of the suction pipe inlet. (2) Relocate the suction filter close to the suction pipe inlet, with the suction pipe inlet facing downward so that trapped sand and other extraneous material can fall out under its own weight during normal vehicle operation. (3) Replace the fuel cap with a cap that has a pressure relief opening pressure setting requiring less negative pressure to open, so that the fuel tank will not deform under negative pressure even if worst-case clogging of the vent line occurs. The revised fuel cap will vent under negative pressure conditions of -3.2 ~ -7.1kPa. (4) Replace the fuel tank with a fuel tank that has increased rigidity so that the fuel tank will not deform under negative pressure up to the opening pressure of the fuel cap pressure relief valve. (5) Replace the evaporative emissions canister and leak detection module if the existing suction filter exceeds a specified weight value, indicating that the suction filter contains excessive dust contaminants. 	8/9/2019	6807

	P
	Some 2015 -2017 MY JeepL Renegade, RAM ProMaster City and Fiat 500X vehicles may experience engine cooling fan noise, engine cooling fan module failure and or a MIL P0481 Cooling Fan 2. Failure of the engine cooling fan motor can cause the engine to overheat and possible engine damage/failure due to overheating. Root cause was determined to be excessive friction and loads between motor bushing and shaft due to inadequate lubrication content in the bushing, out of specification cylindricity and sub-standard radial strength, leading to bushing wear which leads the engine cooling fan to fail.
165

	P
	<p>The affected part number 11538674895 relates to the Thermostat (including a map controlled heating element). This component has been used beginning with 07/2016 in production. It also has been used in service since 7/2016 as replacement part, whenever a component with part number 11537647751 used in production by 06/2016 was malfunctioning. Analysis have shown, that in about 100 percent of all cases for model year 2016 models listed above, the originally built thermostat (11537647751) was replaced due to a disconnected pin of the heating element caused by corrosion due to moisture ingress in the thermostat housing. The corrosion leads to an increased power resistance of the connecting (pin), which is detected by the OBD system including fault code storage and MIL illumination. After this thermostat malfunction is detected (confirmed), the thermostat is still mechanical controlled (wax elements melts due to rising engine cooling water temperature and not map controlled by the heating element anymore) as a conventional thermostat. The succeeding built in thermostat (11538674895) didn't show significant numbers of malfunctions as pre described and so could be handled as a robust hardware. The Weibull and valid failure values reported in this document for test group GBMXV01.6N18 and part number 11538674895 relates therefore to the build thermostat with part number 11537647751. Component with part number 11538674895 is a robust hardware and itself has/had no malfunction, but was/is working properly.</p> <p>187</p> <p>188 Some 2017 MY Alfa Romeo Giulia vehicles, equipped with a 2.0L engine, may have Powertrain Control Module (PCM??) software that sets erroneous fault codes and causes the Malfunction Indicator Light (MIL??) to illuminate. This condition may cause the vehicle to stall after restart following refueling, while the vehicle is stat</p>
	<p>Problem Description: The reductive agent fluid (AdBlue) could contaminate the temperature sensor, causing the Malfunction Indicator Light (MIL) to come on. Additionally, high heat levels can cause the AdBlue fluid to react with the heating fins, causing a variation in internal resistance and the MIL to come on. If the MIL is on, the vehicle will not pass an emissions inspection.</p> <p>Corrective Action: Replace the reductive agent heating element (AdBlue heater).</p> <p>189 AdBlue Heater Repair Kit - 5611989708</p>
	<p>Due to high temperature conditions and low gasoline quality (inadequate additives), the gasoline filter in the high pressure fuel pump can begin to degrade.</p> <p>As the filter deteriorates, small particles of filter material detach and enter the fuel flow.</p> <p>190 These particles can accumulate at the high pressure valve and trigger storage of a fault code and illumination of the MIL.</p> <p>191 The involved vehicle's engine may be equipped with pistons from a particular production period that were produced with a diameter larger than the specification. This may cause the vehicle to run rough, create an abnormal sound, emit smoke from the exhaust, and illuminate warning lights and messages. Also, a reduction of p</p> <p>192 On some 2016-2018 Infiniti Q50 and Q60 vehicles (2.0L engine), a small amount of fuel may seep from the low-pressure fuel hose. Repeated heat stress may be causing deterioration of the hose which may also result in a loss of flexibility. This loss of flexibility may result in slight fuel seepage only upon startup with a cold engine.</p> <p>193 On some 2016-2018 Infiniti Q50 and Q60 vehicles (2.0L engine), a small amount of fuel may seep from the low-pressure fuel hose. Repeated heat stress may be causing deterioration of the hose which may also result in a loss of flexibility. This loss of flexibility may result in slight fuel seepage only upon startup with a cold engine.</p> <p>194 Some 2018 MY Jeep Cherokee vehicles may have fuel tubes that were torn or have partial material loss along the tube which can result in a fuel leak and subsequent engine compartment fire. This was caused by the urethane nesting blocks, which are used to align the tube and connector during the connector insertion process.</p> <p>195 Some 2018 MY Jeep Cherokee vehicles may have fuel tubes that were torn or have partial material loss along the tube which can result in a fuel leak and subsequent engine compartment fire. This was caused by the urethane nesting blocks, which are used to align the tube and connector during the connector insertion process.</p> <p>196 Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.</p>
	<p>Component: Vehicle Emission Certification Information Labels (VEC)</p> <p>Golf- Emission Control Label were printed with the incorrect EVAP Group</p> <p>Production Part Number: 06K 010 005 AK</p> <p>197 Replacement Part Number: 06K 010 005 BE</p>
	<p>Due to weak material, the filter inside of the injector can tear which leads to contamination of the fuel injector with metal shavings resulting in leakage. The leakage subsequently triggers fault code entry and MIL illumination.</p> <p>198</p>
	<p>Due to high temperature conditions and low gasoline quality (inadequate additives), the gasoline filter in the high pressure fuel pump can begin to degrade.</p> <p>As the filter deteriorates, small particles of filter material detach and enter the fuel flow.</p> <p>199 These particles can accumulate at the high pressure valve and trigger storage of a fault code and illumination of the MIL.</p>
	<p>Due to high temperature conditions and low gasoline quality (inadequate additives), the gasoline filter in the high pressure fuel pump can begin to degrade.</p> <p>As the filter deteriorates, small particles of filter material detach and enter the fuel flow.</p> <p>200 These particles can accumulate at the high pressure valve and trigger storage of a fault code and illumination of the MIL.</p> <p>201 An Electronic Control Unit (ECU) in the subject vehicles has improper programming that could lead a component in the Continuously Variable Transmission (CVT) to unnecessarily cycle and experience abnormal wear. If this component becomes damaged, the Malfunction Indicator Lamp (MIL) may illuminate in the instrument clus</p> <p>202 An Electronic Control Unit (ECU) in the subject vehicles has improper programming that could lead a component in the Continuously Variable Transmission (CVT) to unnecessarily cycle and experience abnormal wear. 248	Volkswagen Group of America, Inc. will initiate an Emissions Service Action with Customer Notification (26K2) to install a replacement AdBlue Heater on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	7/26/2018	5947
249	In accordance with the amended Consent Decree, VW submitted a Notice of Approved Emissions Modification ? Correction (AEM-C1) in order to update the software calibration via Service Action 2323 which corrects the dosing model. Service Action 2323 will follow the AEM-C process	12/14/2018	36548
250	To ensure your confidence in our product to customer in all states, Honda is extending the powertrain warranty for 6 years with unlimited mileage from the original sale date. A part of the Warranty Extension terms is the inclusion for any customer that exhibits the symptom to be eligible for Honda's Product Update PUDR-18-010-00 (HNX-RR-2018-0000795) previously launched in 21 affected cold weather states and those repairs are listed below: Repair #1: Replace the A/C unit ECU, reset the maintenance minder, change the engine oil, and reflash the ECU and TCU software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure. Some vehicles had the updated A/C unit ECU installed as a part of a running change and would require only those repairs listed in repair #2 below. Repair #2: Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.	1/28/2019	256332
251	An inspection of the fuel pump and high pressure quick connector for leaks and or cracks. If cracks or fuel leaks are present, the fuel pump will be replaced and a fuel pump cover kit will be installed. A small amount of vehicles are expected to require fuel pump replacement. If no cracks or leaks are present, a fuel pump cover kit will be installed to protect the fuel pump and related components.	3/7/2019	21394
252	(H3U) Certain 18-19MY LX vehicles identified as having defective fuel tanks will have the fuel tanks replaced. (D3T) Some 14-19MY LX vehicles may have received a suspect fuel tank from the suspect range as a replacement service part. The vehicles will have fuel tank manufactured date inspected and if it falls within the suspect manufactured dates the fuel tank will be replaced. Otherwise the vehicle is not affected and no further action will be required.	3/8/2019	6
253	The necessary hardware and software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other Improvements submission, dated June 16, 2019.	7/22/2019	12570
254	FCA US will perform an emissions-related voluntary safety recall (UC4) on affected vehicles to replace the instrument panel cluster.	2/7/2019	2
255	MNA has decided to do a voluntary emissions recall (#373) for MYs 2011-2015 and a service campaign (#374) for MYs 2016-2018 vehicles to 7re-flash?? or upload a new software version into the engine control module, free of charge.	2/7/2019	2784
256	MNA has decided to do a voluntary emissions recall (#373) for MYs 2011-2015 and a service campaign (#374) for MYs 2016-2018 vehicles to 7re-flash?? or upload a new software version into the engine control module, free of charge.	2/7/2019	2252
257	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	78954
258	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	78954
259	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	705
260	FCA US LLC (FCA) will extend the warranty period from 3 years or 36,000 miles (3 years or 50,000 miles for vehicles covered under the California Emission Warranty) to an additional 1 year/Unlimited miles from Warranty Bulletin notification (X79) for vehicles already out of the warranty period to replace the fuel pump module.	7/1/2019	611

261	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
262	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
263	In Voluntary Safety Recall U73, some 2017-2018 MY Chrysler Pacifica PHEV vehicles contain Powertrain Control ("PCM") software that does not remove positive torque requests from the engine controller if the CAN-C bus stops communicating while the cruise control is requesting positive torque. In the instance of a short in the ve
264	An incorrect specification front exhaust tube (with catalytic converter included) may have been installed on a limited number of 2019 Nissan Altima vehicles. This error is due to the part pick area operator sending non-US parts to the assembly line to support a trial build.
	Some 2014-2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
265	To correct this problem, Kia will reprogram the ECU data.
	Some 2014-2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
266	To correct this problem, Kia will reprogram the ECU data.
267	The Vehicle Emissions Control Information (VECI) label was not installed on certain vehicles.
268	There is a possibility that moisture in the air may cause a filter in the air injection pump to degrade. This degradation could cause damage to other parts of the vehicle emission system and illuminate the check engine light (Malfunction Indicator Light).
	On certain Powertrain Control Modules (PCM), the software controlling the hydraulic valve clearance adjuster may operate improperly when transitioning from cylinder deactivation to full cylinder activation modes. As a result, an intake valve rocker arm may come out of position and make contact with internal engine parts, which may cause an engine misfire, loss of engine power, and/or Malfunction Indicator Light (MIL) illumination. ?
269	In the worst case, engine stall without the ability to be restarted can occur while driving, which may increase the risk of a crash. No accidents, injuries, or deaths have been reported from the field to date as a result of this defect.
270	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
271	The Engine Control Module (ECMs) in the subject vehicles are equipped with software to monitor the rear O2 sensors. Under a specific condition, this software may not detect a malfunctioning sensor due to an error in the software.
272	The Engine Control Module (ECMs) in the subject vehicles are equipped with software to monitor the rear O2 sensors. Under a specific condition, this software may not detect a malfunctioning sensor due to an error in the software.
273	The Engine Control Module (ECMs) in the subject vehicles are equipped with software to monitor the rear O2 sensors. Under a specific condition, this software may not detect a malfunctioning sensor due to an error in the software.
274	The Engine Control Module (ECMs) in the subject vehicles are equipped with software to monitor the rear O2 sensors. Under a specific condition, this software may not detect a malfunctioning sensor due to an error in the software.
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
275	
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.

298	Suzuki will conduct a voluntary emissions recall campaign to perform the following actions: (1) Install a cover that closes the opening between the left rear wheel housing and the fender lining, where the suction pipe inlet is located, to reduce the inflow of sand or other extraneous material in the vicinity of the suction pipe inlet. (2) Relocate the suction filter close to the suction pipe inlet, with the suction pipe inlet facing downward so that trapped sand and other extraneous material can fall out under its own weight during normal vehicle operation. (3) Replace the fuel cap with a cap that has a pressure relief opening pressure setting requiring less negative pressure to open, so that the fuel tank will not deform under negative pressure even if worst-case clogging of the vent line occurs. The revised fuel cap will vent under negative pressure conditions of -3.2 ~ -7.1kPa. (4) Replace the fuel tank with a fuel tank that has increased rigidity so that the fuel tank will not deform under negative pressure up to the opening pressure of the fuel cap pressure relief valve.	8/9/2019	6807

307	<p>To ensure customer confidence in our product, Honda is extending the powertrain warranty from the original 5 years/60,000 miles to 6 years with unlimited mileage from the original sale date. This warranty extension applies to any engine components, such as camshafts, rocker arm assemblies, or spark plugs, requiring repair due to damage.</p> <p>A part of the Warranty Extension terms includes any customer that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-011-01 (EPA HNX-RR-2019-0000073) previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>No action is required unless, during the applicable warranty period, the customer's vehicle starts to experience any of the concerns listed above. Based on the inspection results, the necessary repairs may include software updates to the ECU and TCM, A/C control unit replacement, changing the engine oil, replacement of the camshafts, rocker arm assemblies, or spark plugs, or other associated repairs, which will be performed for free.</p> <p>If customers previously paid for eligible out of pocket repairs, they may be entitled to reimbursement. The reimbursement process will be addressed in a separate future mailing to the customer.</p>	6/29/2019	84018

If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally hig</p> <p>323 The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally hig</p> <p>Some 2018 Dodge Challenger (7LA??) and Dodge Charger (7LD??) vehicles contain a software vulnerability that may result in the inability to cancel cruise control (PCC??) during a CAN-C twisted pair short. In this condition the vehicle may continue at a steady speed or accelerate.</p> <p>Some vehicles, noted above, within this Voluntary Safety Recall may have calibrations with the Cold Start Emissions Reduction Strategy (CSERS) diagnostic, for ignition timing performance, which is inadvertently disabled when the engine oil temperature is below 10°C.</p> <p>324</p>

	Q	R	S
312	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	3
313	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	2553
314	For all affected vehicles the front exhaust pipe will be replaced with the correct part.	6/3/2019	47
315	For all affected vehicles the front exhaust pipe will be replaced with the correct part.	6/3/2019	2534
316	For all affected vehicles the front exhaust pipe will be replaced with the correct part.	6/3/2019	2534
317	FCA US will conduct a Customer Satisfaction Notification (V54) on affected vehicles to replace the engine cooling fan module.	7/3/2019	5978
318	Kia will replace the oil filler caps through a dealer service campaign free of charge.	9/2/2019	18
319	Kia will replace the oil filler caps through a dealer service campaign free of charge.	9/2/2019	307
320	Kia will replace the oil filler caps through a dealer service campaign free of charge.	9/2/2019	34
321	Daimler AG will extend the emissions warranty of the engine control unit software for fault codes related to the outside temperature sensor for the affected vehicles to 120,000 miles / 10 years. The introduction of a software modification for the engine control unit ensures that this issue can no longer occur from June 2017 onward.	3/13/2019	29
322	This campaign instructs when the remedy becomes available, any authorized Toyota dealer will perform a software update for the hybrid system FREE OF CHARGE. In addition, for customer satisfaction, if the vehicle has experienced an inverter failure with certain hybrid system faults related to this condition, the inverter assembly will be replaced.	1/28/2019	50101
323	This campaign instructs when the remedy becomes available, any authorized Toyota dealer will perform a software update for the hybrid system FREE OF CHARGE. In addition, for customer satisfaction, if the vehicle has experienced an inverter failure with certain hybrid system faults related to this condition, the inverter assembly will be replaced.	1/22/2019	50101
324	FCA US is conducting an emissions-related voluntary safety recall (U60) on affected vehicles that, in addition to correcting the safety issue, reprograms the powertrain control module with new software that corrects the CSERS diagnostic calibration.	6/21/2018	5961

	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.
352	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in locations with these extreme hot weather (+100 deg. F) and low barometric pressure (+1,000 ft. elev.) conditions. When this occurs, excess gas can enter the engine, which may cause the engine to run rich and potentially hesitate/stop.
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.
353	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in locations with these extreme hot weather (+100 deg. F) and low barometric pressure (+1,000 ft. elev.) conditions. When this occurs, excess gas can enter the engine, which may cause the engine to run rich and potentially hesitate/stop.
	Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.
354	Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in locations with these extreme hot weather (+100 deg. 	Warranty Replacement Part Numbers / Version (Model Year/Model/Engine Code): 06K906070AB V9344 (MY13-14 Jetta, CPFA) 06K906070T V9345 (MY13-14 Jetta, CPLA) 06K906070AC V9346 (MY13-14 Beetle/Beetle Convertible, CPFA) 06K906070AA V9347 (MY13-14 Beetle/Beetle Convertible, CPLA) 06K906070P V9360 (MY14 Jetta, CPFA) 06K906070D V9361 (MY14 Jetta, CPFA) 06K906071E V9362 (MY14 Beetle/Beetle Convertible, CPFA) 06K906071D V9363 (MY14 Beetle/Beetle Convertible, CPKA) 06K906070J V9364 (MY14 Passat, CPFA) 06K906070H V9365 (MY14 Passat, CPKA)
	The conditions below are referenced from the following Field Fix documents: FF_DV2.0B5F_06_18 FF_DV2.03PA_10_18 FF_EV2.0B5F_13_18 FF_EV2.03PA_14_18
	-Lambda Control, Dew Point End Conditioner Pre-Probe, and Quick Start after Catalyst Sensor: Event: NOx emissions above the FTP standard, found on one vehicle during internal testing (& could not be duplicated in other test vehicles), due to an inaccurately adapted second control loop ? a result of inhomogeneous exhaust gas distribution under certain engine load conditions affecting the lambda value expected by the ECM compared to the lambda value measured by the first lambda sensor. Solutions: (1) Correct the target lambda value for specific blocks within the fuel calibration map. (2) Enable quick start of the second lambda sensor, so the ECM can use its measured value as a secondary input sooner to modify the fuel mixture should it need to. -Suction Tube Model: Event: Under certain conditions, after a startup overshoot, a small rpm fluctuation may occur which may be noticed by customers. Solution: Previous analysis showed a difference in take-off behavior between a break-through start and a normal start. Differences in the reset function timing during ignition-ON, resulted in incorrect values of the initialization variables, incorrect values as reference variables, may pose issues in the initial crank-case vent

366	Due to inappropriate programming of the PCM for the Electric Variable Valve Timing Control (EVTC) actuator control, the EVTC control mode may unnecessarily fluctuate under certain conditions. The OBD system may falsely detect a malfunction of P100C for "EVTC actuator rotation signal malfunction".
367	Due to inappropriate programming of the PCM for the Electric Variable Valve Timing Control (EVTC) actuator control, the EVTC control mode may unnecessarily fluctuate under certain conditions. The OBD system may falsely detect a malfunction of P100C for "EVTC actuator rotation signal malfunction".
368	This issue occurred when the powertrain control software was modified to correct an issue related to the P1D7F code inadvertently setting during uncommon conditions (i.e. low battery voltage, etc.) and resulting in nuisance Malfunction Indicator Light (MIL) faults. The resulting fix?? (making P1D7F a non-MIL code) inadvertently resulted in additional OBD-related issues.
369	There is a possibility that the blower motor fan hub in the involved vehicles was produced with improper dimensions. A blower motor fan hub with improper dimensions may develop a crack over time. If a vehicle is continuously operated with this condition, the damage may worsen, leading to an abnormal noise and eventually a

371	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
372	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
373	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
374	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
375	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
376	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
377	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
378	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
379	The involved vehicles are equipped with a certain 3.5-liter V6 gasoline engine. The diaphragm material in the fuel pulsation dampers in this engine may harden over time and crack, causing fuel to leak. A fuel leak in the presence of an ignition source can increase the risk of a vehicle fire.
380	Customer Complaint: MIL on, vibration, and engine compartment noise Component: Catalytic Converter Support Bracket Production Part Number (Catalyst): 7P0 254 301 CX Part analysis reflects part number: 7P0 254 301 CX Due to improper positioning of a welding tool, the load-bearing cross-section of the support bracket weld for the passenger side catalytic converter (cylinders 4-6) could be too thin; which could lead to a crack and/or break at the support bracket weld. A compromised support bracket can lead to increased exhaust system vibrations and, subsequently, adverse stress on the catalytic converter pipe's manifold flange causing it to break.

	Audi is releasing an AEM Correction pursuant to paragraph 7.7 of Appendix B to the Second Partial Consent Decree (Appendix B). In addition, Audi is making other software changes as part of a remedial plan pursuant to Appendix B, paragraph 6.1.7. During the same service action, Audi also intends to make other improvements to the software. The hardware and software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other Improvements submission, dated June 18, 2019. With respect to the AEM Correction, the necessary information can be found in Submission Packages 1-5 (submitted 6/18/2019, following the defined consent decree submission pathway). In addition, Volkswagen also provides the following information: Complaint: MIL on Component: Oxygen Sensor Production Part Number Analyses: 059 906 262 Q -AEM-C Service Action replacement part numbers: o04L 906 262 B (Oxygen Sensor) o4H0 254 750 HX (Exhaust Pipe w/ Oxidation Catalyst and Diesel Particulate Filter) o4H0 298 099 (Installation Kit for Exhaust Pipe w/ Oxidation Catalyst and Diesel Particulate Filter) DTCs Present: P0133 - O2 Sensor Circ., Bank 1-Sensor 1 Slow Response The changes to software are described in detail in Submission Packages 6-8 of the Notice of AEM Correction, OBD Remedial Plan, Other Improvements submission, and in summary within the enclosed field fix documents, dated June 18, 2019. 	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
	During fuel tank manufacturing, the fuel tank vent pipe on the evaporative return line was not properly welded to the fuel tank and may separate. This results in potential for a fuel leak and causes the vehicle to exceed evaporative emissions standards.
	In voluntary safety recall U73, some 2017-2018 MY Chrysler Pacifica PHDVehicles contain Powertrain Control ("PCM") software that does not remove positive torque requests from the engine controller if the C&C Bus stops communicating while the cruise control is requesting positive torque. In the instance of a short in the ve
	There was a possibility that the fuel filler pipe may not have been properly reconnected to the fuel tank. In this condition, the vehicles could leak fuel and may not meet certain U.S. federal motor vehicle safety standard requirements. In the presence of an ignition source, a fuel leak could increase the risk of a fire.
	There was a possibility that the fuel filler pipe may not have been properly reconnected to the fuel tank. In this condition, the vehicles could leak fuel and may not meet certain U.S. federal motor vehicle safety standard requirements. In the presence of an ignition source, a fuel leak could increase the risk of a fire.
	There was a possibility that the fuel filler pipe may not have been properly reconnected to the fuel tank. In this condition, the vehicles could leak fuel and may not meet certain U.S. federal motor vehicle safety standard requirements. In the presence of an ignition source, a fuel leak could increase the risk of a fire.
	Some 2014-2016 model year KIA Forte and Elantras may exhibit an issue with NMOC control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
	To correct this problem, Kia will reprogram the ECU data.
	The Vehicle Emissions Control Information (VECI) label was not installed on certain vehicles.
	On certain Powertrain Control Modules (PCM), the software controlling the hydraulic valve clearance adjuster may operate improperly when transitioning from cylinder deactivation to full cylinder activation modes. As a result, an intake valve rocker arm may come out of position and make contact with internal engine parts, which may cause an engine misfire, loss of engine power, and/or Malfunction Indicator Light (MIL) illumination.
	In the worst case, engine stall without the ability to be restarted can occur while driving, which may increase the risk of a crash. No accidents, injuries, or deaths have been reported from the field to date as a result of this defect.
	On affected vehicles, the Mechatronic Unit service replacement was configured with a European software calibration.
	Part numbers involved:
	Europe Spec Part Number: OC6 325 025 B 202 with SW (6301)
	USA Spec Part Number: OC6 325 025 B 203 with SW (6304 and 6404)
	Some 2014 MY 6.4L Dodge Challenger ("LC") vehicles, equipped with a manual transmission may have received a service flash that enables the Cylinder Imbalance Diagnostic ("CID"). With this diagnostic turned on in the service release, there are no calibrations enabled that will allow the monitor to pass or fail. This calibration

394 The necessary hardware and software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other Improvements submission, dated June 18, 2019.	7/22/2019	12570
395 MNA has decided to do a voluntary emissions recall (#373) for MYs 2011-2015 and a service campaign (#374) for MYs 2016-2018 vehicles to 7re-flash?? or upload a new software version into the engine control module, free of charge.	2/7/2019	850
396 MNA has decided to do a voluntary emissions recall (#373) for MYs 2011-2015 and a service campaign (#374) for MYs 2016-2018 vehicles to 7re-flash?? or upload a new software version into the engine control module, free of charge.	2/7/2019	2480
397 The necessary hardware and software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other Improvements submission, dated June 18, 2019.	7/22/2019	3986
398 The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	69381
399 The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	20399
400 The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	17584
FCA US LLC (FCA) will extend the warranty period from 3 years or 36,000 miles (3 years or 50,000 miles for vehicles covered under the California Emission Warranty) to an additional 1 year/Unlimited miles from Warranty Bulletin notification (X79) for vehicles already out of the warranty period to replace the fuel pump module.	7/1/2019	2570
402 The repair is to replace the fuel tank.	9/16/2019	15
403 FCA US is conducting emissions-related voluntary safety recall (U73) on affected vehicles that, in addition to correcting the safety issue, reprograms the BPCM with new software that corrects the PFC clearing issues.	7/2/2018	3324
404 Any authorized Toyota dealer will inspect the fuel filler pipe to confirm if it is properly installed and, IF NECESSARY, replace the fuel filler pipe FREE OF CHARGE.	3/22/2019	205
405 Any authorized Toyota dealer will inspect the fuel filler pipe to confirm if it is properly installed and, IF NECESSARY, replace the fuel filler pipe FREE OF CHARGE.	3/22/2019	140
406 Any authorized Toyota dealer will inspect the fuel filler pipe to confirm if it is properly installed and, IF NECESSARY, replace the fuel filler pipe FREE OF CHARGE.	3/22/2019	140
KIA modified EMS data so that catalyst heating is entered (to ensure the catalyst reaches the activation temperature) regardless of the number of restarts and any interrupt.	8/8/2019	6076
407 KIA will reprogram the ECU through a voluntary service campaign.	9/17/2019	491
408 An owner notification letter with a VECI label will be sent to all customers of record. The letter will provide easy instructions to the owner on how to affix the label. The owner will be given the option of having a dealer affix the label at no charge. Since the new label can be easily installed, and doing so will reduce customer income		
409 Dealers will reprogram the PCM with improved hydraulic valve adjustment control software. There will be no charge for this service to vehicle owners.	8/25/2019	18210
Emissions Service Action (J38C4) will be released to remedy the affected vehicles.	10/9/2019	6019
411 FCA US will conduct a Voluntary Emissions Recall (V33) on affected vehicles to reprogram the powertrain control module with software to correct the issue.	5/16/2019	267

	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.

	<p>To ensure customer confidence in our product, Honda is extending the powertrain warranty from the original 5 years/60,000 miles to 6 years with unlimited mileage from the original sale date. This warranty extension applies to any engine components, such as camshafts, rocker arm assemblies, or spark plugs, requiring repair due to damage.</p> <p>A part of the Warranty Extension terms includes any customer that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-011-01 [EPA HNX-RR-2019-0000073] previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>No action is required unless, during the applicable warranty period, the customer's vehicle starts to experience any of the concerns listed above. Based on the inspection results, the necessary repairs may include software updates to the ECU and TCM, A/C control unit replacement, changing the engine oil, replacement of the camshafts, rocker arm assemblies, or spark plugs, or other associated repairs, which will be performed for free.</p> <p>If customers previously paid for eligible out of pocket repairs, they may be entitled to reimbursement. The reimbursement process will be addressed in a separate future mailing to the customer.</p>	6/29/2019	55249

451	<p>In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may result in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.</p>
452	<p>In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may result in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.</p>
453	<p>On some 2019 Nissan Altima vehicles, due to an assembly process error that has since been corrected, the retainer clip on the connection between the low-pressure fuel tube and the high-pressure fuel pump may not have been locked into position properly. If the retainer clip is not locked into position properly, the fuel tube may leak fuel.</p>
454	<p>The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally high current flow through the IPM, which can result in a fuel leak.</p>
455	<p>The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally high current flow through the IPM, which can result in a fuel leak.</p>
456	<p>There was a possibility that the fuel filler pipe may not have been properly reconnected to the fuel tank. In this condition, the vehicles could leak fuel and may not meet certain U.S. federal motor vehicle safety standard requirements. In the presence of an ignition source, a fuel leak could increase the risk of a fire.</p>
457	<p>Some 2018 MY 2.3L Explorer gasoline turbocharged direct injection (GTDI) vehicles were built with a fuel pressure sensor that may not have been assembled correctly into the fuel tank/jumper tube, which can result in a fuel leak.</p>
458	<p>The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally high current flow through the IPM, which can result in a fuel leak.</p>
459	<p>The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally high current flow through the IPM, which can result in a fuel leak.</p>
460	<p>Some 2018 Dodge Challenger (7LA7?) and Dodge Charger (7LD7?) vehicles contain a software vulnerability that may result in the inability to cancel cruise control (PCC??) during a CAN-C twisted pair short. In this condition the vehicle may continue at a steady speed or accelerate.</p> <p>Some vehicles, noted above, within this Voluntary Safety Recall may have calibrations with the Cold Start Emissions Reduction Strategy (CSERS) diagnostic, for ignition timing performance, which is inadvertently disabled when the engine oil temperature is below 10°C.</p>
461	<p>Some 2018 Dodge Challenger (7LA7?) and Dodge Charger (7LD7?) vehicles contain a software vulnerability that may result in the inability to cancel cruise control (PCC??) during a CAN-C twisted pair short. In this condition the vehicle may continue at a steady speed or accelerate.</p> <p>Some vehicles, noted above, within this Voluntary Safety Recall may have calibrations with the Cold Start Emissions Reduction Strategy (CSERS) diagnostic, for ignition timing performance, which is inadvertently disabled when the engine oil temperature is below 10°C.</p>
462	<p>When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.</p>

	P
545	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
546	In the affected vehicles, there is a possibility that the torque converter in the Continuously Variable Transmission (CVT) could fail. Under certain conditions this could result in a loss of motive power. Loss of motive power while driving at higher speeds could increase the risk of crash.
	Some 2014*2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
547	To correct this problem, Kia will reprogram the ECU data.
548	There is a possibility that moisture in the air may cause a filter in the air injection pump to degrade. This degradation could cause damage to other parts of the vehicle emission system and illuminate the check engine light (Malfunction Indicator Light).
	On certain Powertrain Control Modules (PCM), the software controlling the hydraulic valve clearance adjuster may operate improperly when transitioning from cylinder deactivation to full cylinder activation modes. As a result, an intake valve rocker arm may come out of position and make contact with internal engine parts, which may cause an engine misfire, loss of engine power, and/or Malfunction Indicator Light (MIL) illumination. ?
549	In the worst case, engine stall without the ability to be restarted can occur while driving, which may increase the risk of a crash. No accidents, injuries, or deaths have been reported from the field to date as a result of this defect.
	Complaint: No known customer complaint Component: EGR Cooler Possible DTCs Present: No DTCs present Analysis: Due to a parts catalog error, an incorrect EGR Cooler and Valve Assembly may have been installed on some vehicles during a past service repair visit. Audi will inspect, and if needed replace the component as a proactive measure to ensure continued emissions compliance. Incorrect Part Number: EGR Cooler (059 131 515 FJ) Correct Part Number: EGR Cooler (059 131 515 FP)

	On affected vehicles, the Mechatronic Unit service replacement was configured with a European software calibration. Part numbers involved: Europe Spec Part Number: OCG 325.025.8.203 with SW (5801) USA Spec Part Number: OCG 325.025.8.203 with SW (6304 and 6404)
552	
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
553

580	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	4
581	To ensure customer confidence in our product, Honda is extending the powertrain warranty from the original 5 years/60,000 miles to 6 years with unlimited mileage from the original sale date. This warranty extension applies to any engine components, such as camshafts, rocker arm assemblies, or spark plugs, requiring repair due to damage. Apart of the Warranty Extension terms includes any customer that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-010-01 (EPA HNX-RR-2018-0000785) previously launched in 21 affected cold weather states. Those repairs are listed below: No action is required unless, during the applicable warranty period, the customer's vehicle starts to experience any of the concerns listed above. Based on the inspection results, the necessary repairs may include software updates to the ECU and TCM, A/C control unit replacement, changing the engine oil, replacement of the camshafts, rocker arm assemblies, or spark plugs, or other associated repairs, which will be performed for free. If customers previously paid for eligible out of pocket repairs, they may be entitled to reimbursement. The reimbursement process will be addressed in a separate future mailing to the customer.	6/29/2019	256332

	P
591	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may result in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
592	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may result in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
593	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may result in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
594	On some 2019 Nissan Altima vehicles, due to an assembly process error that has since been corrected, the retainer clip on the connection between the low-pressure fuel tube and the high-pressure fuel pump may not have been locked into position properly. If the retainer clip is not locked into position properly, the fuel tube may leak.
595	On some 2019 Nissan Altima vehicles, due to an assembly process error that has since been corrected, the retainer clip on the connection between the low-pressure fuel tube and the high-pressure fuel pump may not have been locked into position properly. If the retainer clip is not locked into position properly, the fuel tube may leak.
596	The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally high current to flow through the IPM.
597	The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormally high current to flow through the IPM.
598	Complaint: No known complaints. Component: Vehicle Emission Certification Information (VECI) Label Part Number ? Production: 06K-010-005-AQ Part Number ? Replacement: 06K-010-005-AQ Part Number ? Analysis: Does not apply Analysis: 31 vehicles were produced with a VECI label containing a missing character in the 5th position of the evaporative family. Corrected VECI labels will be installed to correct the current Evaporative Family Name 7KVG_A_0110VBD?? by adding an 7R?? to the 5th character position. The final corrected Evaporative Family Name is 7KVGAR0110VBD??.
599	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.
600	Defect Description: Complaint: No known customer complaints Component: Engine Control Module (ECM) Software (SW) Calibration Possible DTCs Present: No known DTCs Analysis: The ECM Clamp 30 (constant battery voltage) Circuit Monitor, which affects the ?engine-off timer?? calculation, may impede activation of the Malfunction Indicator Light (MIL). Also, during an internal review, BOSCH (supplier) identified that the O2 Sensor aging correction factor could lead to a deviation in the calculated O2 Sensor lambda value for vehicles with 50,000 miles or more. MY Make Model Production Part Number Replacement Part Number 2017 Audi A3 8V0.907.115.B V00068V0.907.115.B V0007 2017 Audi A4 8V0.907.115.C V00068V0.907.115.C V0006 2018 Audi A3 8V0.907.115.B V00068V0.907.115.B V0007 2018 Audi A4 8V0.907.115.C V00068V0.907.115.C V0006
601	Some 2014-2016 model year KIA Forte may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition. To correct this problem, Kia will reprogram the ECU data.

	P
621	<p>The reason for the replacement of the sensor is a leak in the sensor housing. Fuel and fuel vapors cause swelling and deterioration of the sealant gel between the housing and the sensor plate. Gasoline and gasoline vapors can then enter the housing and come into contact with the sensor plate which leads to incorrect pressure measurements (caused by sensor drifts). OBD II system detects these sensor drifts and triggers the MIL along with a corresponding fault code storage.</p>
622	<p>The NVLD temperature sensor module is a smart device. A software error causing a communication failure between the NVLD temperature sensor and the engine control module leads to an OBD fault code entry (U029F) and MIL illumination. The temperature sensor module cannot be reprogrammed and must be replaced.</p>
623	<p>The NVLD temperature sensor module is a smart device. A software error causing a communication failure between the NVLD temperature sensor and the engine control module leads to an OBD fault code entry (U029F) and MIL illumination. The temperature sensor module cannot be reprogrammed and must be replaced.</p>
624	<p>Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.</p> <p>Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in locations with these extreme hot weather (+100 deg. F) and low barometric pressure (+1,000 ft. elev.) conditions. When this occurs, excess gas can enter the engine, which may cause the engine to run rich and potentially hesitate/stop.</p>
625	<p>Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.</p> <p>Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in locations with these extreme hot weather (+100 deg. F) and low barometric pressure (+1,000 ft. elev.) conditions. When this occurs, excess gas can enter the engine, which may cause the engine to run rich and potentially hesitate/stop.</p>
626	<p>The Engine Control Module (ECM) in certain vehicles was manufactured with a circuit board that was not properly cleaned during circuit board manufacturing. Contamination on the circuit board may cause failed solder joints or open circuits in the traces of the circuit board. The defect is limited to one lot of circuit boards.</p>
627	<p>Warranty Replacement Part Numbers / Version (Model Year/Model/Engine Code):</p> <p>06K906070AB V9344 (MY13-14 Jetta, CPPA) 06K906070TV9345 (MY13-14 Jetta, CPLA) 06K906070AC V9346 (MY13-14 Beetle/Beetle Convertible, CPPA) 06K906070AA V9347 (MY13-14 Beetle/Beetle Convertible, CPLA) 06K906070F V9360 (MY14 Jetta, CPRA) 06K906070D V9361 (MY14 Jetta, CPKA) 06K906071E V9362 (MY14 Beetle/Beetle Convertible, CPRA) 06K906071D V9363 (MY14 Beetle/Beetle Convertible, CPKA) 06K906070J V9364 (MY14 Passat, CPRA) 06K906070H V9365 (MY14 Passat, CPKA)</p> <p>The conditions below are referenced from the following Field Fix documents: FF_DV2.085F_06_18 FF_DV2.03PA_10_18 FF_EV2.085F_13_18 FF_EV2.03PA_14_18</p> <p>-Lambda Control, Dew Point End Conditioner Pre-Probe, and Quick Start after Catalyst Sensor: Event: NOx emissions above the FTP standard, found on one vehicle during internal testing (& could not be duplicated in other test vehicles), due to an inaccurately adapted second control loop ? a result of inhomogeneous exhaust gas distribution under certain engine load conditions affecting the lambda value expected by the ECM compared to the lambda value measured by the first lambda sensor. Solutions: (1) Correct the target lambda value for specific blocks within the fuel calibration map. (2) Enable quick start of the second lambda sensor, so the ECM can use its measured value as a secondary input sooner to modify the fuel mixture should it need to. -Suction Tube Model: Event: Under certain conditions, after a startup overshoot, a small rpm fluctuation may occur which may be noticed by customers. Solution: Previous analysis showed a difference in take-off behavior between a break-through start and a normal start. Differences in the reset function timing during ignition-ON, resulted in incorrect values of the initialization variables, incorrect values as reference variables, may pose issues in the initial crank-case vent</p>

	To eliminate this problem, a more robust hardware (gel with a better fuel resistance) has been used in production and as replacement part since 05/2017 for all models. The pressure-temperature sensor built in the i8 is integrated in the fuel pump. Therefore, the fuel pump must be replaced in case of a malfunction on i8 models.	6/15/2018	3716
621			
	The corrective measure consists of replacing the temperature sensor smart module with a new part and updated software.	5/11/2018	3743

	<p>Audi is releasing an AEM Correction pursuant to paragraph 7.7 of Appendix B to the Second Partial Consent Decree (Appendix B). In addition, Audi is making other software changes as part of a remedial plan pursuant to Appendix B, paragraph 6.1.7. During the same service action, Audi also intends to make other improvements to the software.</p> <p>The hardware and software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other Improvements submission, dated June 18, 2019.</p> <p>With respect to the AEM Correction, the necessary information can be found in Submission Packages 1-5 (submitted 6/18/2019, following the defined consent decree submission pathway). In addition, Volkswagen also provides the following information:</p> <p>-Complaint: MIL on</p> <p>-Component: Oxygen Sensor</p> <p>-Production Part Number Analyses: 059 906 262 Q</p> <p>-AEM-C Service Action replacement part numbers:</p> <p>o04L 906 262 B (Oxygen Sensor)</p> <p>o4HD 234 750 HK (Exhaust Pipe w/ Oxidation Catalyst and Diesel Particulate Filter)</p> <p>o4HD 238 099 (Installation Kit for Exhaust Pipe w/ Oxidation Catalyst and Diesel Particulate Filter)</p> <p>-DTCs Present: P0133 - O2 Sensor Circ., Bank 1-Sensor 1 Slow Response</p> <p>The changes to software are described in detail in Submission Packages 6-8 of the Notice of AEM Correction, OBD Remedial Plan, Other Improvements submission, and in summary within the enclosed field fix documents, dated June 18, 2019. In addition, the software part numbers are as follows:</p> <p>GenerationModelMCurrent AEM ECM Software Target AEM-C Software</p> <p>Gen 2 PCA620154G0907401N 0013 BVAB4G0907401N 0016</p> <p>Gen 2 PCA720154G0907401N 0013 BVAB4G0907401N 0016</p> <p>Gen 2 PCA820154H0907401N 0007 BVAB4H0907401N 0009</p> <p>Gen 2 PC0520158K907401AC 0008 BVAB8K907401AC 0010</p> <p>Gen 2 PCA620164G0907401AA 0010 BVAB4G0907401AA 0012</p> <p>Gen 2 PCA720164G0907401AA 0010 BVAB4G0907401AA 0012</p> <p>Gen 2 PCA820164H0907401N 0007 BVAB4H0907401N 0009</p> <p>Gen 2 PC0520168K907401AC 0008 BVAB8K907401AC 0010</p>
666	
667	Certain 2015-2017MY Honda Accord, 2015-2019MY Acura TLX, 2016-2018MY Acura MDX vehicles equipped with a V6 engine, fuels containing high sodium content can contaminate certain internal components in the fuel pump and cause a reduced fuel flow to the engine.
668	Certain 2015-2017MY Honda Accord, 2015-2019MY Acura TLX, 2016-2018MY Acura MDX vehicles equipped with a V6 engine, fuels containing high sodium content can contaminate certain internal components in the fuel pump and cause a reduced fuel flow to the engine.
669	Certain 2015-2017MY Honda Accord, 2015-2019MY Acura TLX, 2016-2018MY Acura MDX vehicles equipped with a V6 engine, fuels containing high sodium content can contaminate certain internal components in the fuel pump and cause a reduced fuel flow to the engine.
670	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
671	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
672	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
673	<p>Software that was designed and certified for a certain model year has been built into the below listed model years without disclosure.</p> <p>Analysis determined software calibrations within this report have one of the following concerns:</p> <p>No Information Available - Unique software on a low number of vehicles that are not possible to analyze.</p> <p>Possible CO2 Impact - Software designed and certified for a model year but that was then applied to a different model year without a field fix. It's possible that CO2 values may differ between the model years.</p> <p>Pre-series software installed - Vehicles with pre-series software in the field.</p> <p>Production ECU Software Replacement ECU Software Test Group</p> <p>BV0906259K_0001BV0906259H_0002FVGAV02.0AJA</p> <p>5G0906259L_00015G0906259D_0004GVGAV02.0APA</p> <p>5G0906259L_00025G0906259D_0004GVGAV02.0APA</p> <p>BV0906259K_0001BV0906259H_0002GVGAV02.0AJA</p> <p>4G5907115A_V4304G5907115A_0003GVGAV02.0AAC</p>
674	Some 2014-2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
675	To correct this problem, Kia will reprogram the ECU data.
675	The Vehicle Emissions Control Information (VECI) label was not installed on certain vehicles.
676	On certain Powertrain Control Modules (PCM), the software controlling the hydraulic valve clearance adjuster may operate improperly when transitioning from cylinder deactivation to full cylinder activation modes. As a result, an intake valve rocker arm may come out of position and make contact with internal engine parts, which may cause an engine misfire, loss of engine power, and/or Malfunction Indicator Light (MIL) illumination. In the worst case, engine stall without the ability to be restarted can occur while driving, which may increase the risk of a crash. No accidents, injuries, or deaths have been reported from the field to date as a result of this defect.

	Q	R	S
666	The necessary hardware and software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other Improvements submission, dated June 18, 2019.	7/22/2019	3986
667	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	11246
668	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	17584
669	The dealer will update the software for the engine control unit with programming that eliminates sodium contamination in the fuel pump. The dealer will also perform a diagnostic scan of the vehicle. If the diagnostic scan confirms a previous occurrence of engine stalling, the fuel pump will be replaced for free.	3/25/2019	40245
	FCA US LLC (FCA) will extend the warranty period from 3 years or 36,000 miles (3 years or 50,000 miles for vehicles covered under the California Emission Warranty) to an additional 1 year/Unlimited miles from Warranty Bulletin notification (X79) for vehicles already out of the warranty period to replace the fuel pump module.	7/1/2019	1575
670			
	FCA US LLC (FCA) will extend the warranty period from 3 years or 36,000 miles (3 years or 50,000 miles for vehicles covered under the California Emission Warranty) to an additional 1 year/Unlimited miles from Warranty Bulletin notification (X79) for vehicles already out of the warranty period to replace the fuel pump module.	7/1/2019	1552
671			
	FCA US LLC (FCA) will extend the warranty period from 3 years or 36,000 miles (3 years or 50,000 miles for vehicles covered under the California Emission Warranty) to an additional 1 year/Unlimited miles from Warranty Bulletin notification (X79) for vehicles already out of the warranty period to replace the fuel pump module.	7/1/2019	3958
672			
673	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	28
	KIA modified EMS data so that catalyst heating is entered (to ensure the catalyst reaches the activation temperature) regardless of the number of restarts and any interrupt.	8/8/2019	2348
674	KIA will reprogram the ECU through a voluntary service campaign.	9/17/2019	11
675	An owner notification letter with a VECI label will be sent to all customers of record. The letter will provide easy instructions to the owner on how to affix the label. The owner will be given the option of having a dealer affix the label at no charge. Since the new label can be easily installed, and doing so will reduce customer income		
676	Dealers will reprogram the PCM with improved hydraulic valve adjustment control software. There will be no charge for this service to vehicle owners.	8/25/2019	80549

When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.

When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.

	<p>To ensure customer confidence in our product, Honda is extending the powertrain warranty from the original 5 years/60,000 miles to 6 years with unlimited mileage from the original sale date. This warranty extension applies to any engine components, such as camshafts, rocker arm assemblies, or spark plugs, requiring repair due to damage.</p> <p>Apart of the Warranty Extension terms includes any customer that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-011-01 [EPA HNX-RR-2019-0000073] previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>No action is required unless, during the applicable warranty period, the customer's vehicle starts to experience any of the concerns listed above. Based on the inspection results, the necessary repairs may include software updates to the ECU and TCM, A/C control unit replacement, changing the engine oil, replacement of the camshafts, rocker arm assemblies, or spark plugs, or other associated repairs, which will be performed for free.</p> <p>If customers previously paid for eligible out of pocket repairs, they may be entitled to reimbursement. The reimbursement process will be addressed in a separate future mailing to the customer.</p>	6/29/2019	61710

	P
728	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
729	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
730	The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormal high
731	The involved vehicles contain software used to control the Intelligent Power Module (IPM) within the inverter assembly, a part of the vehicle's hybrid system. If a specific transistor within the IPM fails in a certain way during a high-load driving condition, such as during hard acceleration, there is a possibility for an abnormal high
732	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or an abnormal engine whirling noise.
733	There was a possibility that the fuel filler pipe may not have been properly reconnected to the fuel tank. In this condition, the vehicles could leak fuel and may not meet certain U.S. federal motor vehicle safety standard requirements. In the presence of an ignition source, a fuel leak could increase the risk of a fire.
734	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.
735	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.
736	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.
737	Some 2014*2016 model year KIA Forte may exhibit an issue with NMOS control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition. To correct this problem, Kia will reprogram the ECU data.

744	<p>The particle measure sensor has been replaced due to following reasons:</p> <p>1. The measuring electrode of the sensor element can be damaged due to design weakness.</p> <p>2. The heating electrode of the sensor element can be damaged due to design weakness.</p> <p>3. The protective cap of the sensor is blocked by soot.</p> <p>4. Foreign particles and/or scratches can cause a short circuit in the electrode.</p>
745	The suspect vehicles may have an engine software defect. If the vehicle is being operated at speeds of approximately 2 miles per hour (low engine RPM), which can be encountered during heavy stop-and-go (bumper-to-bumper) traffic conditions, the transmission may shift into neutral or park or the engine may shut down.
746	Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.
747	Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.
748	Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.
749	Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.
750	The NVLD temperature sensor module is a smart device. A software error causing a communication failure between the NVLD temperature sensor and the engine control module leads to an OBD fault code entry (U029F) and MIL illumination.
751	The temperature sensor module cannot be reprogrammed and must be replaced.
752	An Electronic Control Unit (ECU) in the subject vehicles has improper programming that could lead a component in the Continuously Variable Transmission (CVT) to unnecessarily cycle and experience abnormal wear. If this component becomes damaged, the Malfunction Indicator Lamp (MIL) may illuminate in the instrument cluster.
752	An Electronic Control Unit (ECU) in the subject vehicles has improper programming that could lead a component in the Continuously Variable Transmission (CVT) to unnecessarily cycle and experience abnormal wear. If this component becomes damaged, the Malfunction Indicator Lamp (MIL) may illuminate in the instrument cluster.

789	Certain fuel tanks may have been produced with an internal deformation in the inner tank. This deformation may cause the fuel tank indicator float to get stuck on the tank inner wall not allowing correct fuel level indication. There are 2 parts of this campaign as described below.
790	Certain fuel tanks may have been produced with an internal deformation in the inner tank. This deformation may cause the fuel tank indicator float to get stuck on the tank inner wall not allowing correct fuel level indication. There are 2 parts of this campaign as described below.
791	Audi is releasing an AEM Correction pursuant to paragraph 7.7 of Appendix B to the Second Partial Consent Decree (Appendix B). In addition, Audi is making other software changes as part of a remedial plan pursuant to Appendix B, paragraph 6.1.7. During the same service action, Audi also intends to make other improvements to the software. The hardware and software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other Improvements submission, dated June 18, 2019. With respect to the AEM Correction, the necessary information can be found in Submission Packages 1-5 (submitted 6/18/2019, following the defined consent decree submission pathway). In addition, Volkswagen also provides the following information: -Complaint: MIL on -Component: Oxygen Sensor -Production Part Number Analyses: 059 906 262 Q -AEM-C Service Action replacement part numbers: o04L 906 262 B (Oxygen Sensor) o4HD 254 750 HK (Exhaust Pipe w/ Oxidation Catalyst and Diesel Particulate Filter) o4HD 288 099 (Installation Kit for Exhaust Pipe w/ Oxidation Catalyst and Diesel Particulate Filter) -DTCs Present: P0133 - O2 Sensor Circ., Bank 1-Sensor 1 Slow Response The changes to software are described in detail in Submission Packages 6-8 of the Notice of AEM Correction, OBD Remedial Plan, Other Improvements submission, and in summary within the enclosed field fix documents, dated June 18, 2019. In addition, the software part numbers are as follows: GenerationModelMYCurrent AEM ECM SoftwareTarget AEM-C Software Gen 2 PC A620144G0907401N 0013 BVA84G0907401N 0016 Gen 2 PC A720144G0907401N 0013 BVA84G0907401N 0016 Gen 2 PC A820144H0907401F 0013 BVA84H0907401F 0016 Gen 2 PC C520144K5907401J 0013 BVA8K5907401J 0014
792	Some 2019 MY Jeep Cherokee (7XL7?) may experience the instrument panel cluster becoming nonfunctional and becoming blank due to a capacitor inside the instrument panel cluster being installed in the wrong polarity direction. Loss of the instrument cluster may prevent activation of the malfunction indicator lamp (MIL??).
793	Upon start-up of the vehicle, the engine software does not properly complete the secondary air monitor, resulting in a low IUMPR ratio. The low IUMPR ratio does not meet the OBD II regulatory requirements.
794	Upon start-up of the vehicle, the engine software does not properly complete the secondary air monitor, resulting in a low IUMPR ratio. The low IUMPR ratio does not meet the OBD II regulatory requirements.
795	Certain 2015-2017MY Honda Accord, 2015-2019MY Acura TLX, 2016-2018MY Acura MDX vehicles equipped with a V6 engine, fuels containing high sodium content can contaminate certain internal components in the fuel pump and cause a reduced fuel flow to the engine.
796	Certain 2015-2017MY Honda Accord, 2015-2019MY Acura TLX, 2016-2018MY Acura MDX vehicles equipped with a V6 engine, fuels containing high sodium content can contaminate certain internal components in the fuel pump and cause a reduced fuel flow to the engine.
797	Certain 2015-2017MY Honda Accord, 2015-2019MY Acura TLX, 2016-2018MY Acura MDX vehicles equipped with a V6 engine, fuels containing high sodium content can contaminate certain internal components in the fuel pump and cause a reduced fuel flow to the engine.
798	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
799	During fuel tank manufacturing, the fuel tank vent pipe on the evaporative return line was not properly welded to the fuel tank and may separate. This results in potential for a fuel leak and causes the vehicle to exceed evaporative emissions standards.
800	Software that was designed and certified for a certain model year has been built into the below listed model years without disclosure. Analysis determined software calibrations within this report have one of the following concerns: -No Information Available - Unique software on a low number of vehicles that are not possible to analyze. -Possible CO2 Impact - Software designed and certified for a model year but that was then applied to a different model year without a field fix. It's possible that CO2 values may differ between the model years. -Pre-series software installed - Vehicles with pre-series software in the field. Production ECU Software Replacement ECU Software Test Group 8V0906259K_00018V0906259H_0002FVGAV02.0AUA 5G0906259L_00015G0906259D_0004GVGAV02.0APA 5G0906259L_00025G0906259D_0004GVGAV02.0APA 8V0906259K_00018V0906259H_0002GVGAV02.0AUA 4G5907115A_04304G5907115A_0003GVGAV02.0AAC

	P
804	In Voluntary Safety Recall U73, some 2017-2018 MY Chrysler Pacifica PHEV vehicles contain Powertrain Control ("PCM") software that does not remove positive torque requests from the engine controller if the CAN-C bus stops communicating while the cruise control is requesting positive torque. In the instance of a short in the ve
	Some 2014*2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
805	To correct this problem, Kia will reprogram the ECU data.
	Some 2014*2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
806	To correct this problem, Kia will reprogram the ECU data.
	Complaint: No known customer complaint Component: EGR Cooler Possible DTCs Present: No DTCs present Analysis: Due to a parts catalog error, an incorrect EGR Cooler and Valve Assembly may have been installed on some vehicles during a past service repair visit. Audi will inspect, and if needed replace the component as a proactive measure to ensure continued emissions compliance.
	Incorrect Part Number: EGR Cooler (059 131 515 F) Correct Part Number: EGR Cooler (059 131 515 FP)
807	
808	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
809	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
810	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
811	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
812	The Engine Control Module (ECMs) in the subject vehicles are equipped with software to monitor the rear O2 sensors. Under a specific condition, this software may not detect a malfunctioning sensor due to an error in the software.
813	The Engine Control Module (ECMs) in the subject vehicles are equipped with software to monitor the rear O2 sensors. Under a specific condition, this software may not detect a malfunctioning sensor due to an error in the software.
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
814	
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
815	
816	The powertrain control module (PCM) has a software issue that misinterprets sensor inputs as a Fuel Level Sensor (Fuel Gauge Sending unit) issue and may turn on the malfunction indicator lamp (MIL), and store a diagnostic trouble code (DTC) P0461 ? Fuel Level Sensor Circuit Range/Performance.
817	Toyota has received reports about potential symptoms, such as a whine noise from the transmission while driving, harsh shifting, reduced power, and master warning light/check engine light illumination, in the subject vehicles that are equipped with a model UA80 transmission. There is a possibility that a washer tab, designed
818	Toyota has received reports about potential symptoms, such as a whine noise from the transmission while driving, harsh shifting, reduced power, and master warning light/check engine light illumination, in the subject vehicles that are equipped with a model UA80 transmission. There is a possibility that a washer tab, designed
	Some 2018 Jeep Grand Cherokee (7WK??), Dodge Durango (7WD??) vehicles contain a software vulnerability that may result in the inability to cancel cruise control (PCC??) during a CAN-C twisted pair short. In this condition the vehicle may continue at a steady speed or accelerate.
	Some vehicles, noted above, within this Voluntary Safety Recall may have calibrations with the Cold Start Emissions Reduction Strategy (CSERS) diagnostic, for ignition timing performance, which is inadvertently disabled when the engine oil temperature is below 10°C.
819	
	During vehicle production, a non-U.S. specification selective catalytic reduction (SCR) catalyst may have been installed in some vehicles. Installation of this SCR catalyst is not compliant with U.S. emissions/regulatory requirements, and may impact vehicle tailpipe emissions under certain conditions.
	Euro Part Number: 4G0 254 400 A US Part Number: 4G0 254 400 Bor BX
820	VWGA will launch this campaign on or about April 18 as a required vehicle updated (inspect and replace) followed by a formal mail out on or about July 2018.
821	There is a possibility that moisture in the air may cause a filter in the air injection pump to degrade. This degradation could cause damage to other parts of the vehicle emission system and illuminate the check engine light (Malfunction Indicator Light).
822	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.

	<div>Analysis determined software calibrations within this report have one of the following concerns: -OBD Phase in - OBD Phase in requirements in MY14 might not be met -Mode A deactivated - TCM Software Calibrations were released to the field with Mode A concerns. -Under some conditions, affected vehicles with the transmission software calibrations (CG300045E_4305) may experience elevated FTP NOx emissions. -No Information Available - Unique software on a low number of vehicles that are not possible to analyze. -Possible CO2 impact - Software designed and certified for a model year but that was then applied to a different model year without a field fix. It's possible that CO2 values may differ between the model years. -Pre-series software installed - Vehicles with pre-series software in the field. (Mode A) Production SoftwareReplacement SoftwareECM or TCMTest Group 02E300054M_260702E300054M_2607TCMCADXXV02.03UA 02E300057Q_310702E300057Q_3118TCMCADXXV02.03UA 02E300057Q_3119096927750LR_2062TCMCADXXV02.03UA 02E300057R_311402E300057R_3107TCMCADXXV02.03UA 02E300058N_350102E300058N_3505TCMCADXXV02.03UA 02E300058N_351002E300058N_3509TCMCADXXV02.03UA 096927750HC_1111096927750LR_2062TCMCADXXV02.03UA 096927750MN_2239096927750LR_2062TCMCADXXV02.03UA 02E300057R_311402E300057R_3107TCMCADXXV02.03PA 02E300057R_311402E300058N_3509TCMDADXXV02.03UA No Info, CO2 impact, Pre-Series Production SoftwareReplacement SoftwareECM or TCMTest Group 02E300058P_351502E300058P_3509TCMDADXXV02.03UA 02E300058P_351002E300058P_3509TCMDADXXV02.03PA 1K0907115AF_00101K0907115AT_0020ECMEADXXV02.03PA 02E300058P_350902E300058P_3510TCMEADXXV02.03PA</div>
830	
831	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
832	
833	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
834	
835	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
836	There is a possibility that moisture in the air may cause a filter in the air injection pump to degrade. This degradation could cause damage to other parts of the vehicle emission system and illuminate the check engine light (Malfunction Indicator Light).

	Q	R	S
830	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	2
831	<p>To ensure confidence in our product to customer in all states, Honda is extending the powertrain warranty on the camshafts, rocker arm assemblies, and spark plugs for 6 years with unlimited mileage from the original sale date.</p> <p>A part of the Warranty Extension terms is the inclusion for any customers located outside of the 21 states involved in PUDR-18-011-00 (HNX-RR-2019-0000069) that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-010-01 previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.</p> <p>Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU, if applicable, software with the latest version and replace the A/C unit ECU, if necessary. Reset the throttle learned values and do the ECU idle learn procedure.</p>	4/11/2019	84018

844	<p>Some 2015 -2017 MY Jeep® Renegade, RAM ProMaster City and Fiat 500X vehicles may experience engine cooling fan noise, engine cooling fan module failure and/or a MIL P0481 Cooling Fan 2. Failure of the engine cooling fan motor can cause the engine to overheat and possible engine damage/failure due to overheating.</p> <p>Root cause was determined to be excessive friction and loads between motor bushing and shaft due to inadequate lubrication content in the bushing, out of specification cylindricity and sub-standard radial strength, leading to bushing wear which leads the engine cooling fan to fail.</p>

	P
878	<p>The NVLD temperature sensor module is a smart device. A software error causing a communication failure between the NVLD temperature sensor and the engine control module leads to an OBD fault code entry (U029F) and MIL illumination. The temperature sensor module cannot be reprogrammed and must be replaced.</p>
879	<p>Due to a logistic failure the model year 2017 Vehicle Emission Control Information (VEC) Label was inadvertently affixed to 1282 model year 2018 3-series models produced between November 14, 2017 and February 11, 2018. That means the MY2017 VECI label was affixed instead of the correct MY2018 VECI Label.</p>
880	<p>Due to a logistic failure the model year 2017 Vehicle Emission Control Information (VEC) Label was inadvertently affixed to 1282 model year 2018 3-series models produced between November 14, 2017 and February 11, 2018. That means the MY2017 VECI label was affixed instead of the correct MY2018 VECI Label.</p>
881	<p>An Electronic Control Unit (ECU) in the subject vehicles has improper programming that could lead a component in the Continuously Variable Transmission (CVT) to unnecessarily cycle and experience abnormal wear. If this component becomes damaged, the Malfunction Indicator Lamp (MIL) may illuminate in the instrument cluster.</p>
882	<p>Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.</p> <p>Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in locations with these extreme hot weather (+100 deg. F) and low barometric pressure (+1,000 ft. elev.) conditions. When this occurs, excess gas can enter the engine, which may cause the engine to run rich and potentially hesitate/stop.</p>
883	<p>Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.</p>
884	<p>Certain 2017-2018 model year Cadillac XTS vehicles equipped with an 8-speed transmission were service programmed with incorrect transmission control module (TCM) software. Vehicles programmed with this software may, under certain downhill driving conditions, inappropriately remain in a mode of delayed upshifts that could cause engine lugging.</p>
885	<p>The Engine Control Module (ECM) in certain vehicles was manufactured with a circuit board that was not properly cleaned during circuit board manufacturing. Contamination on the circuit board may cause failed solder joints or open circuits in the traces of the circuit board. The defect is limited to one lot of circuit boards.</p>
886	<p>Warranty Replacement Part Numbers / Version (Model Year/Model/Engine Code):</p> <p>06K906070AB V9344 (MY13-14 Jetta, CPPA) 06K906070T V9345 (MY13-14 Jetta, CPLA) 06K906070AC V9346 (MY13-14 Beetle/Beetle Convertible, CPPA) 06K906070AA V9347 (MY13-14 Beetle/Beetle Convertible, CPLA) 06K906070F V9360 (MY14 Jetta, CPRA) 06K906070D V9361 (MY14 Jetta, CPKA) 06K906071E V9362 (MY14 Beetle/Beetle Convertible, CPRA) 06K906071D V9363 (MY14 Beetle/Beetle Convertible, CPKA) 06K906070J V9364 (MY14 Passat, CPRA) 06K906070H V9365 (MY14 Passat, CPKA)</p> <p>The conditions below are referenced from the following Field Fix documents:</p> <p>FF_DV2.085F_06_18 FF_DV2.03PA_10_18 FF_EV2.085F_13_18 FF_EV2.03PA_14_18</p> <p>-Lambda Control, Dew Point End Conditioner Pre-Probe, and Quick Start after Catalyst Sensor: Event: NOx emissions above the FTP standard, found on one vehicle during internal testing (& could not be duplicated in other test vehicles), due to an inaccurately adapted second control loop ? a result of inhomogeneous exhaust gas distribution under certain engine load conditions affecting the lambda value expected by the ECM compared to the lambda value measured by the first lambda sensor. Solutions: (1) Correct the target lambda value for specific blocks within the fuel calibration map. (2) Enable quick start of the second lambda sensor, so the ECM can use its measured value as a secondary input sooner to modify the fuel mixture should it need to. -Suction Tube Model: Event: Under certain conditions, after a startup overshoot, a small rpm fluctuation may occur which may be noticed by customers. Solution: Previous analysis showed a difference in take-off behavior between a break-through start and a normal start. Differences in the reset function timing during ignition-ON, resulted in incorrect values of the initialization variables, incorrect values as reference variables, may pose issues in the initial crank-case vent</p>

	<p>To ensure your confidence in our product to customer in all states, Honda is extending the powertrain warranty for 6 years with unlimited mileage from the original sale date. A part of the Warranty Extension terms is the inclusion for any customer that exhibits the symptom to be eligible for Honda's Product Update PUDR-18-010-00 (HNX-RR-2018-0000795) previously launched in 21 affected cold weather states and those repairs are listed below:</p> <p>Repair #1: Replace the A/C unit ECU, reset the maintenance minder, change the engine oil, and reflash the ECU and TCU software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.</p> <p>Some vehicles had the updated A/C unit ECU installed as a part of a running change and would require only those repairs listed in repair #2 below:</p> <p>Repair #2: Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU software with the latest version. Reset the throttle learned values and do the ECU idle learn procedure.</p>	1/28/2019	312816

	P
930	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
931	Some 2011-2016 model year Dodge Charger Pursuit vehicles equipped with a 3.6 L or 5.7L engine may experience a fuel odor inside the vehicle, fuel leaks (including at the primary fuel module connector to the body harness) and browning of electrical terminals to the primary fuel module connector.
	Some 2014-2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
932	To correct this problem, Kia will reprogram the ECU data.
933	The Vehicle Emissions Control Information (VECI) label was not installed on certain vehicles.
	On certain Powertrain Control Modules (PCM), the software controlling the hydraulic valve clearance adjuster may operate improperly when transitioning from cylinder deactivation to full cylinder activation modes. As a result, an intake valve rocker arm may come out of position and make contact with internal engine parts, which may cause an engine misfire, loss of engine power, and/or Malfunction Indicator Light (MIL) illumination. ?
934	In the worst case, engine stall without the ability to be restarted can occur while driving, which may increase the risk of a crash. No accidents, injuries, or deaths have been reported from the field to date as a result of this defect.
935	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
936	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
937	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
938	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
939	
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
940	
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
941	
942	The powertrain control module (PCM) has a software issue that misinterprets sensor inputs as a Fuel Level Sensor (Fuel Gauge Sending unit) issue and may turn on the malfunction indicator lamp (MIL), and store a diagnostic trouble code (DTC) P0461 ? Fuel Level Sensor Circuit Range/Performance.
943	Some 2017-2018 MY Jeep® Renegade vehicles equipped with flex fuel E85 compatible fuel systems (sales code XKN), may experience cavitation which will cause loss of fuel pressure under certain environmental conditions while using standard 10% ethanol (E10) fuel due to the fuel pump inlet cover being out of specification. In some cases, the fuel pump lock ring that secures the fuel pump module to the fuel tank may have been installed incorrectly during production. More specifically, the lock ring may not have been completely engaged during re-installation following offline rework at the supplier. If the fuel pump lock ring is not properly engaged, the fuel pump may not pump fuel properly, which may cause an abnormal noise or engine malfunction.
944	On some 2019 Nissan Altima vehicles, the fuel pump lock ring that secures the fuel pump module to the fuel tank may have been installed incorrectly during production. More specifically, the lock ring may not have been completely engaged during re-installation following offline rework at the supplier. If the fuel pump lock ring is not properly engaged, the fuel pump may not pump fuel properly, which may cause an abnormal noise or engine malfunction.
945	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.
946	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.
947	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.
	Malfunctions can occur in the passenger frontal air bag system, turn signals, and/or the engine starting system in addition to false instrument cluster warnings. This is caused by weak retention force of wiring harness connector terminals, resulting in electrical communication disruption between various vehicle control modules.
948	No accidents, injuries, or deaths have been reported from the field to date as a result of this defect.
949	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may result in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172.

	Q	R	S
	<p>Suzuki will conduct a voluntary emissions recall campaign to perform the following actions:</p> <p>(1) Install a cover that closes the opening between the left rear wheel housing and the fender lining, where the suction pipe inlet is located, to reduce the inflow of sand or other extraneous material in the vicinity of the suction pipe inlet.</p> <p>(2) Relocate the suction filter close to the suction pipe inlet, with the suction pipe inlet facing downward so that trapped sand and other extraneous material can fall out under its own weight during normal vehicle operation.</p> <p>(3) Replace the fuel cap with a cap that has a pressure relief opening pressure setting requiring less negative pressure to open, so that the fuel tank will not deform under negative pressure even if worst-case clogging of the vent line occurs. The revised fuel cap will vent under negative pressure conditions of -3.2 ~ -7.1kPa.</p> <p>(4) Replace the fuel tank with a fuel tank that has increased rigidity so that the fuel tank will not deform under negative pressure up to the opening pressure of the fuel cap pressure relief valve.</p>		
950	(5) Replace the evaporative emissions canister and leak detection module if the existing suction filter exceeds a specified weight value, indicating that the suction filter contains excessive dust contaminants.	8/9/2019	6120
	<p>To ensure confidence in our product to customer in all states, Honda is extending the powertrain warranty on the camshafts, rocker arm assemblies, and spark plugs for 6 years with unlimited mileage from the original sale date.</p> <p>Apart of the Warranty Extension terms is the inclusion for any customers located outside of the 21 states involved in PUDR-18-011-00 (HNX-RR-2019-0000069) that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-010-01 previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may result in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.</p> <p>Reset the maintenance minder, change the engine oil, and reflash the ECU and TCU, if applicable, software with the latest version and replace the A/C unit ECU, if necessary. Reset the throttle learned values and do the ECU idle learn procedure.</p>	4/11/2019	84018
952	The latest approved software calibration will be applied to affected vehicles.	3/28/2019	1
953	FCAUS will conduct a Voluntary Emissions Recall (U67) on all affected 2011-2016 MY 2.0L/2.4L WGE vehicles, to install new sulfur resistant catalyst and reprogram the powertrain control module software on affected vehicles which will bring them back into (or maintain) exhaust emissions compliance.	2/25/2019	135258
	<p>To ensure customer confidence in our product, Honda is extending the powertrain warranty from the original 5 years/60,000 miles to 6 years with unlimited mileage from the original sale date. This warranty extension applies to any engine components, such as camshafts, rocker arm assemblies, or spark plugs, requiring repair due to damage.</p> <p>Apart of the Warranty Extension terms includes any customer that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-011-01 (EPA HNX-RR-2019-0000073) previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>No action is required unless, during the applicable warranty period, the customer's vehicle starts to experience any of the concerns listed above. Based on the inspection results, the necessary repairs may include software updates to the ECU and TCM, A/C control unit replacement, changing the engine oil, replacement of the camshafts, rocker arm assemblies, or spark plugs, or other associated repairs, which will be performed for free.</p> <p>If customers previously paid for eligible out of pocket repairs, they may be entitled to reimbursement. The reimbursement process will be addressed in a separate future mailing to the customer.</p>	6/29/2019	84018

975	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
976	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
977	In extreme cold weather, customers who drive short drive cycles may experience abnormal levels of engine oil dilution. In some cases, abnormal engine oil level may results in DTC(s): P0300, P0301, P0302, P0303, P0304, or P0172 or abnormal engine whirling noise.
978	On some 2019 Nissan Altima vehicles, due to an assembly process error that has since been corrected, the retainer clip on the connection between the low-pressure fuel tube and the high-pressure fuel pump may not have been locked into position properly. If the retainer clip is not locked into position properly, the fuel tube may
979	On some 2019 Nissan Altima vehicles, due to an assembly process error that has since been corrected, the retainer clip on the connection between the low-pressure fuel tube and the high-pressure fuel pump may not have been locked into position properly. If the retainer clip is not locked into position properly, the fuel tube may
980	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.
981	When driving on very dusty roads, a large amount of dust can enter the vent line that provides fresh air to the carbon canister, causing a restriction in the vent line. If this occurs, air flow through the evaporative system may be impacted such that excessive negative pressure is created in the fuel tank. This can cause deformation of the fuel tank, which can lead to fuel tank cracks.
982	The S550 is equipped with an electrical pump in the cooling circuit, that will be commanded on if there is a cabin heating request. When this pump is being activated, an unintended coolant backflow through the engine radiator and an additional radiator in the wheel housing might occur. Under very low ambient temperature conditions (below 20°F) in conjunction with specific driving conditions (constantly very low engine load request) and still commanded closed engine thermostat, this possible coolant backflow leads to a temperature drop in the engine cooling circuit. The OBD thermostat monitor, which compares the measured coolant temperature with a modelled target value, misinterprets this coolant backflow as a stuck open thermostat, because the actual coolant temperature is significantly lower than expected. The MIL will falsely illuminate, if this scenario happens in 2 consecutive engine warm-up cycles in which the OBD-related thermostat monitor is running.
983	Analysis have shown that the component NOx Sensor (up- and downstream) has been malfunctioning due to magnesium oxidation at the sensor element which leads to deviation of the sensor curve and thus to a fault code storage and MIL illumination.

984	The necessary software changes are described in detail in the Notice of AEM Correction, OBD Remedial Plan, and Other improvements submission, dated October 25, 2019.	11/25/2019	3673
985	The corrective measure consists of replacing the fuel injectors with an improved version if the original fails during this extended warranty period. To prevent leakages, fuel injectors with a more robust filter material have been used in production starting with 02/15. BMW will also reimburse owners who have already replaced this part at their own expense at any time before the end of the warranty period.	2/7/2018	4558
986	The corrective measure consists of replacing the fuel injectors with an improved version if the original fails during this extended warranty period. To prevent leakages, fuel injectors with a more robust filter material have been used in production starting with 02/15. BMW will also reimburse owners who have already replaced this part at their own expense at any time before the end of the warranty period.	2/7/2018	4038
987	Volkswagen Group of America, Inc. has initiated an Emissions Service Action with Customer Notification (24CX) to install a replacement Snow Flap and if necessary Oxygen Sensor on the affected vehicles. Customers are instructed to take their vehicle to an authorized dealer of the manufacturer for this service.	8/1/2017	39784
988	Volkswagen Group of America, Inc. will pro-actively release an Emissions Recall 24CV/23W1 to address the replacements of the Snow Flap and O2 Sensor on Model Year 2009-2014 Volkswagen 2.0L TDI Engine vehicles (Generation I). All authorized dealers will be notified of this Emission Recall, and owners of affected vehicles will be mailed a notification letter that includes all needed information regarding this issue. Dealer Notification: On or about August 11th, 2017 Customer Notification: On or about August 18th, 2017	8/11/2017	51249
989	Volkswagen Group of America, Inc. will pro-actively release an Emissions Recall 24CV/23W1 to address the replacements of the Snow Flap and O2 Sensor on Model Year 2009-2014 Volkswagen 2.0L TDI Engine vehicles (Generation I). All authorized dealers will be notified of this Emission Recall, and owners of affected vehicles will be mailed a notification letter that includes all needed information regarding this issue. Dealer Notification: On or about August 11th, 2017 Customer Notification: On or about August 18th, 2017	8/11/2017	51339

	Q	R	S
	<p>Volkswagen Group of America, Inc. will pro-actively release an Emissions Recall 24CV/23W1 to address the replacements of the Snow Flap and O2 Sensor on Model Year 2009-2014 Volkswagen 2.0L TDI Engine vehicles (Generation I).</p> <p>All authorized dealers will be notified of this Emission Recall, and owners of affected vehicles will be mailed a notification letter that includes all needed information regarding this issue.</p> <p>Dealer Notification: On or about August 11th, 2017</p> <p>Customer Notification: On or about August 18th, 2017</p>	8/11/2017	62604
	<p>The corrective measure consists of replacing the PM Sensor with an upgraded sensor with a more robust sensing element, updating the calibration and changing the sensor installation position.</p> <p>991 The new sensor element has been in use in production and as a replacement part since 09/2015.</p> <p>992 FCA US will perform an emissions-related voluntary safety recall (U39) on affected vehicles to inspect the fuel supply tube for damage and replace those that are torn or have partial material loss.</p>	4/20/2018 5/24/2018	7384 16192
	<p>General Motors will conduct a safety recall on all affected vehicles to replace the high pressure fuel pump and associated high pressure fuel pipe.</p>	6/19/2018	13
	<p>General Motors will conduct a safety recall on all affected vehicles to replace the high pressure fuel pump and associated high pressure fuel pipe.</p>	6/19/2018	13
	<p>General Motors will conduct a safety recall on all affected vehicles to replace the high pressure fuel pump and associated high pressure fuel pipe.</p>	6/19/2018	213
	<p>General Motors will conduct a safety recall on all affected vehicles to replace the high pressure fuel pump and associated high pressure fuel pipe.</p>	6/19/2018	117
	<p>General Motors will conduct a safety recall on all affected vehicles to replace the high pressure fuel pump and associated high pressure fuel pipe.</p>	6/19/2018	375
	<p>998 FCA US will perform an emissions-related voluntary safety recall (U68) on affected vehicles that, in addition to correcting the safety issue, will reprogram the powertrain control module with new software that corrects the OBD calibration by "turning on" the P0111 diagnostic.</p> <p>999 Owners of affected vehicles will be sent a notification and a replacement label for this campaign so they can replace the label. If customers are not comfortable replacing the labels, they may contact an authorized dealer to have the label replaced free of charge.</p>	7/2/2018 8/15/2018	7256 10

	P
1000	Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.
1001	Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.
1002	Emission certification labels that were replaced on a small amount of vehicles may have been replaced with a label listing incorrect information. The affected emission labels were not affected at the factory, they are replacement service parts. This will cause the vehicle to be non-compliant with emissions regulations.
1003	<p>General Motors has decided that a defect which relates to motor vehicle safety exists in certain 2013 model-year Chevrolet Volt vehicles that received a Hybrid Powertrain Control Module 2 software update in a service procedure performed by a dealer. An error in the software update may prevent the batteries in these vehicles from balancing the voltage among individual battery cells, which under certain circumstances can result in a low-voltage condition in one or more battery cells. If the voltage in a given battery cell falls below a certain level, the vehicle may enter a reduced power mode and notify the driver that propulsion power is reduced. If the vehicle continues to be driven after the vehicle enters reduced power mode, the vehicle may lose propulsion.</p> <p>Due to weak material, the filter inside of the injector can tear which leads to contamination of the fuel injector with metal shavings resulting in leakage. The leakage subsequently triggers fault code entry and MIL illumination.</p>
1004	<p>Some 2012-2017 Nissan Versa, Sentra, Altima and Rogue vehicles are experiencing a hesitation or an engine stop at low speeds in two states with high ambient temperatures and increased elevation. The vehicles are able to be restarted.</p> <p>Nissan has investigated and found that this issue is caused by the ECM miscalculating the amount of purge gas inside the evap canister in locations with these extreme hot weather (>100 deg. F) and low barometric pressure (>1,000 ft. elev.) conditions. When this occurs, excess gas can enter the engine, which may cause the engine to run rich and potentially hesitate/stop.</p> <p>Certain 2017-2018 model year Cadillac XTS vehicles equipped with an 8-speed transmission were service programmed with incorrect transmission control module (TCM) software. Vehicles programmed with this software may, under certain downhill driving conditions, inappropriately remain in a mode of delayed upshifts that cause engine hesitation.</p> <p>The Engine Control Module (ECM) in certain vehicles was manufactured with a circuit board that was not properly cleaned during circuit board manufacturing. Contamination on the circuit board may cause failed solder joints or open circuits in the traces of the circuit board. The defect is limited to one lot of circuit boards.</p> <p>The Engine Control Module (ECM) in certain vehicles was manufactured with a circuit board that was not properly cleaned during circuit board manufacturing. Contamination on the circuit board may cause failed solder joints or open circuits in the traces of the circuit board. The defect is limited to one lot of circuit boards.</p> <p>The Engine Control Module (ECM) in certain vehicles was manufactured with a circuit board that was not properly cleaned during circuit board manufacturing. 1000	Owners of affected vehicles will be sent a notification and a replacement label for this campaign so they can replace the label. If customers are not comfortable replacing the labels, they may contact an authorized dealer to have the label replaced free of charge.	8/15/2018	197
1001	Owners of affected vehicles will be sent a notification and a replacement label for this campaign so they can replace the label. If customers are not comfortable replacing the labels, they may contact an authorized dealer to have the label replaced free of charge.	8/15/2018	25
1002	Owners of affected vehicles will be sent a notification and a replacement label for this campaign so they can replace the label. If customers are not comfortable replacing the labels, they may contact an authorized dealer to have the label replaced free of charge.	8/15/2018	241
1003	General Motors will conduct a Safety Recall to program the Hybrid Control Module 2 with software that will properly balance battery cell charge.	7/3/2018	1081
1004	<p>The corrective measure consists of replacing the fuel injectors with an improved version if the original fails during this extended warranty period. To prevent leakages, fuel injectors with a more robust filter material have been used in production starting with 02/15. BMW will also reimburse owners who have already replaced this part at their own expense at any time before the end of the warranty period.</p>	2/7/2018	4558
1005	Nissan will conduct a Voluntary Service Campaign to reprogram the Engine Control Module with revised evaporative purge logic. This campaign will apply to vehicles in Arizona and Nevada, where they may experience the hot weather and low barometric pressure conditions in which this issue may potentially occur.	8/6/2018	271
1006	General Motors will conduct a Voluntary Emissions Recall to program the TCM with the correct software.	8/9/2018	2106
1007	General Motors will conduct a voluntary emissions recall on all affected vehicles to replace the engine control module.	8/8/2018	200
1008	General Motors will conduct a voluntary emissions recall on all affected vehicles to replace the engine control module.	8/8/2018	1
1009	General Motors will conduct a voluntary emissions recall on all affected vehicles to replace the engine control module.	8/8/2018	8
1010	General Motors will conduct a voluntary emissions recall on all affected vehicles to replace the engine control module.	8/8/2018	142
1011	General Motors will conduct a voluntary emissions recall on all affected vehicles to replace the engine control module.	8/8/2018	22
1012	<p>Volkswagen Group of America, Inc. will pro-actively release an Emissions Service Action with customer notification (24DR) to update ECM Software on the involved vehicles.</p> <p>All authorized Volkswagen dealers will be notified of this Emissions Service Action, and owners of affected vehicles will be mailed a notification letter that includes all needed information regarding this issue.</p>	8/30/2018	46017

	P
	Some 2014-2016 model year KIA Forte and Elantras may exhibit an issue with NMOG control that could lead to an exceedance of the emissions standards under certain specific conditions such as the catalyst heating control is not activated when engine is started at cold condition.
1052	To correct this problem, Kia will reprogram the ECU data.
	Complaint: No known customer complaint Component: EGR Cooler Possible DTCs Present: No DTCs present Analysis: Due to a parts catalog error, an incorrect EGR Cooler and Valve Assembly may have been installed on some vehicles during a past service repair visit. Audi will inspect, and if needed replace the component as a proactive measure to ensure continued emissions compliance.
	Incorrect Part Number: EGR Cooler (059 131 515 F) Correct Part Number: EGR Cooler (059 131 515 FP)
1053	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
1054	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
1055	The vehicles involved are equipped with a Fuel Vapor Separator which, due to a manufacturing fault caused by the supplier, may cause the fuel to evaporate and the vehicle to ignite.
1056	The Engine Control Module (ECM)s in the subject vehicles are equipped with software to monitor the rear O2 sensors. Under a specific condition, this software may not detect a malfunctioning sensor due to an error in the software.
	Some 2018 model year Hyundai G80, G90, Sonata and Santa Fe Sport vehicles have the misprinted mark of engine oil filler caps. Original viscosity is 5W-30, but 0W-30 mark was printed. The supplier made a mistake in selecting the printing plate. Hyundai will replace the misprinted filler caps with the right ones.
1057	
1058	Some 2013 PF 2.0L, 2013 DS 3.6L & 5.7L vehicles may have permanent Fault Codes (PFC) that can be stored in a GPEC or NGC4a engine controller and may not be able to be erased, as required under certain conditions, even after the vehicle is repaired.
	Some 2019 MY Dodge Challenger (7LA??) and Charger (7LD??) and Chrysler 300 (7LX??) vehicles may have been built with an instrument cluster that has an inadvertently disabled watchdog, which may allow a lockup condition to occur. Lockups have been confirmed to happen during sleep, wake, and ignition cycles, but the potential exists during any event that would have caused a reset. With the watchdog disabled the cluster will remain inoperable until a full power reset is performed. Loss of the instrument cluster may prevent activation of the malfunction indicator lamp (7MIL??), warning chimes, messages, cluster gauges such as the speedometer and may increase the risk of a crash.
1059	
	Some 2019 MY Dodge Challenger (7LA??) and Charger (7LD??) and Chrysler 300 (7LX??) vehicles may have been built with an instrument cluster that has an inadvertently disabled watchdog, which may allow a lockup condition to occur. Lockups have been confirmed to happen during sleep, wake, and ignition cycles, but the potential exists during any event that would have caused a reset. With the watchdog disabled the cluster will remain inoperable until a full power reset is performed. Loss of the instrument cluster may prevent activation of the malfunction indicator lamp (7MIL??), warning chimes, messages, cluster gauges such as the speedometer and may increase the risk of a crash.
1060	
1061	The valve springs located inside the engine of the affected vehicles may fracture, which may cause an abnormal noise or engine malfunction.
	Some 2014 - 2016 MY Chrysler 300 and Dodge Charger and 2015 - 2016 MY Dodge Challenger vehicles equipped with a gasoline engine built in the 2nd half of the 2014 calendar year through the 1st half of the 2015 calendar year may have vapor carbon canisters that lead to exceedances of Onboard Refueling Vapor Recovery stand
1062	
	Some 2014 - 2016 MY Chrysler 300 and Dodge Charger and 2015 - 2016 MY Dodge Challenger vehicles equipped with a gasoline engine built in the 2nd half of the 2014 calendar year through the 1st half of the 2015 calendar year may have vapor carbon canisters that lead to exceedances of Onboard Refueling Vapor Recovery stand

1083	FCA US will conduct a Voluntary Emissions Recall (U67) on all affected 2011-2016 MY 2.0L/2.4L WGE vehicles, to install new sulfur resistant catalyst and reprogram the powertrain control module software on affected vehicles which will bring them back into (or maintain) exhaust emissions compliance.	2/25/2019	95487
	<p>To ensure customer confidence in our product, Honda is extending the powertrain warranty from the original 5 years/60,000 miles to 6 years with unlimited mileage from the original sale date. This warranty extension applies to any engine components, such as camshafts, rocker arm assemblies, or spark plugs, requiring repair due to damage.</p> <p>Apart of the Warranty Extension terms includes any customer that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-011-01 (EPA HNX-RR-2019-0000073) previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>No action is required unless, during the applicable warranty period, the customer's vehicle starts to experience any of the concerns listed above. Based on the inspection results, the necessary repairs may include software updates to the ECU and TCM, A/C control unit replacement, changing the engine oil, replacement of the camshafts, rocker arm assemblies, or spark plugs, or other associated repairs, which will be performed for free.</p> <p>If customers previously paid for eligible out of pocket repairs, they may be entitled to reimbursement. The reimbursement process will be addressed in a separate future mailing to the customer.</p>	6/29/2019	77175

	<p>To ensure customer confidence in our product, Honda is extending the powertrain warranty from the original 5 years/60,000 miles to 6 years with unlimited mileage from the original sale date. This warranty extension applies to any engine components, such as camshafts, rocker arm assemblies, or spark plugs, requiring repair due to damage.</p> <p>Apart of the Warranty Extension terms includes any customer that exhibits the symptoms to be eligible for the repairs specified in Honda's Product Update PUDR-18-011-01 [EPA HX-RR-2019-0000073] previously launched in 21 affected cold weather states. Those repairs are listed below:</p> <p>No action is required unless, during the applicable warranty period, the customer's vehicle starts to experience any of the concerns listed above. Based on the inspection results, the necessary repairs may include software updates to the ECU and TCM, A/C control unit replacement, changing the engine oil, replacement of the camshafts, rocker arm assemblies, or spark plugs, or other associated repairs, which will be performed for free.</p> <p>If customers previously paid for eligible out of pocket repairs, they may be entitled to reimbursement. The reimbursement process will be addressed in a separate future mailing to the customer.</p>	6/29/2019	13250
	1086 The latest approved software calibration will be applied to affected vehicles.	3/28/2019	10
	1087 The latest approved software calibration will be applied to affected vehicles.	3/28/2019	1
	1088 The latest approved software calibration will be applied to affected vehicles.	3/28/2019	196
	1089 The latest approved software calibration will be applied to affected vehicles.	3/28/2019	1
	1090 For all affected vehicles the front exhaust pipe will be replaced with the correct part.	6/3/2019	1
	1091 FCA US will conduct a Customer Satisfaction Notification (V54) on affected vehicles to replace the engine cooling fan module.	7/3/2019	3090
	1092 Kia will replace the oil filler caps through a dealer service campaign free of charge.	9/2/2019	714

1093	Kia will replace the oil filler caps through a dealer service campaign free of charge.	9/2/2019	3
1094	Daimler AG will extend the emissions warranty of the engine control unit software for fault codes related to the outside temperature sensor for the affected vehicles to 120,000 miles / 10 years. The introduction of a software modification for the engine control unit ensures that this issue can no longer occur from June 2017 onwards.	3/13/2019	3
1095	Any authorized Toyota dealer will inspect the fuel filler pipe to confirm if it is properly installed and, IF NECESSARY, replace the fuel filler pipe FREE OF CHARGE.	3/22/2019	140
1096	FCA US is conducting an emissions-related voluntary safety recall (U60) on affected vehicles that, in addition to correcting the safety issue, reprograms the powertrain control module with new software that corrects the CSERS diagnostic calibration.	6/21/2018	1240
1097	FCA US is conducting an emissions-related voluntary safety recall (U62) on affected vehicles that, in addition to correcting the safety issue, reprograms the powertrain control module with new software that corrects the CSERS diagnostic calibration.	6/20/2018	64155
	Suzuki will conduct a voluntary emissions recall campaign to perform the following actions: (1) Install a cover that closes the opening between the left rear wheel housing and the fender lining, where the suction pipe inlet is located, to reduce the inflow of sand or other extraneous material in the vicinity of the suction pipe inlet. (2) Relocate the suction filter close to the suction pipe inlet, with the suction pipe inlet facing downward so that trapped sand and other extraneous material can fall out under its own weight during normal vehicle operation. (3) Replace the fuel cap with a cap that has a pressure relief opening pressure setting requiring less negative pressure to open, so that the fuel tank will not deform under negative pressure even if worst-case clogging of the vent line occurs. The revised fuel cap will vent under negative pressure conditions of -3.2 ~ -7.1kPa. (4) Replace the fuel tank with a fuel tank that has increased rigidity so that the fuel tank will not deform under negative pressure up to the opening pressure of the fuel cap pressure relief valve.		
1098	(5) Replace the evaporative emissions canister and leak detection module if the existing suction filter exceeds a specified weight value, indicating that the suction filter contains excessive dust contaminants.	8/9/2019	1805
